Due to the unavailability of data, 2 provinces in China (Hangzhou and Xuzhou) and 1 province in the Indian state of Bihar were excluded from this analysis. This is a cross-sectional study of the association between a series of measures of family policy generosity ("Family policy generosity", M. for many different outcome measures. Policy was measured through regression of a large set of policy measures on family poverty level. A summary of key findings can be found in Table 1. A summary of key findings can be found in Table 1. 1. Familienfinanzierung. Die Kinderfinanzierung sollte nach diesen Kriterien eingestuft werden: 1. Sie sollten im ersten ersten Viertel des Sommers zu einem Jahr von der Bundesagentur zum Verkauf und den Landesbehörden vorgeladen werden. Child poverty rate by policy generosity, in 20 countries, around 2000. The percentages displayed were calculated by dividing the absolute number of poor children (for each outcome measure) within the country's population by the total population. The children under 6 years (age 0–5 years) were excluded from the analysis. Provinces for which the policy instrument was not available, or for which more than 25% of the poverty rate was missing from the dataset, were excluded from the analysis. For further details on the data sources, the countries and variables included in the analyses and the methodology, see DOWE (2015). Missing data. DOWE (2015) estimated the proportion of missing data across all countries using data on 'family' poverty (as an indicator of household living standards), age and sex structure and poverty lines. The final poverty estimates were then adjusted to include the missing data. For further details, see DOWE (2015). Policy instrument definition. Policy instruments were coded according to the Center for International Development at Harvard University (CID) for the full sample. The coding of the instruments is provided in Table 2, in which a score of 0 indicates that a policy instrument was not implemented. All available policy instruments for each country were coded and then divided into four broad policy categories—social transfers, work-related, education and health-related. Where more than one instrument was available for each category, they were then averaged. In f3e1b3768c
