V3-Latest.In a conventional imaging apparatus, a silver halide film exposed by a camera is processed with a developing solution in a developing tank and is then washed and dried by a series of rollers and air blowers in a drying tank. In a conventional developing apparatus, a length of a film is inserted between a pair of feed rollers and fed through a series of rollers in a developing tank. However, with this arrangement, the developing apparatus is large and a short length of a film is wrapped around the rollers in the developing tank. Consequently, the entire developing apparatus has a large size. Conventionally, in order to overcome the above problem, a length of a film is inserted between feed rollers and then fed in a series of rollers. Then, in order to prevent an end of the film from being guided out of the developing tank, a side-lying guide is provided on a side of a feed path of the rollers. In the above conventional apparatus, when a width of a film is changed, the rollers are moved. In this case, when a length of a film is inserted between the rollers, the rollers are positioned at a position of the film in the side-lying guide, and a side-lying guide is inserted between the rollers. Then, when a length of a film is inserted between the rollers, the rollers are rotated to position the rollers at a position of the film in the developing tank. After the rollers are positioned, the feed path of the rollers is closed by a cover of a developing tank. The cover of the developing tank can be opened only when the rollers are positioned at the position of the film in the developing tank. Therefore, when the cover of the developing tank is closed, a time is required for the rollers to be positioned in the developing tank. In addition, it is necessary to accurately position the rollers in the developing tank because the rollers are always biased against the side-lying guide. In the above conventional apparatus, when a length of a film is inserted between the rollers, the rollers are moved and the rollers are positioned at a position of the film in the developing tank. Then, the cover of the developing tank is closed. 2d92ce491b
