## Gs-02 Digi Torrent 64 Windows Build

Description of Dextec DST-1900 DigiTool® ConduR™ System GS-02 DigiTool® Call Center (DCC) Software for PC Notice Validation and Installation of Remote Software. DigiTool also offers a complete range of wireless access. 20–22. Quadriplegia Does Not Facilitate Immersion in Sensory Modality Relearning. Immersion is a critical aspect of motor learning and facilitates the ability to identify and learn the principles of a learned motor skill. Here, the authors examined immersion in relearning of tactile modality skills in individuals with a complete spinal cord injury (SCI) compared with a nonimmersive group. Sensory awareness of hand and foot movement was examined in participants with SCI during relearning of grating, texture, and tactual-kinesthetic discrimination. Participants with SCI had significantly longer average immersion time compared with controls. Participants with SCI also showed reduced latency to contact the target and smaller between-trial variability in target contact times. These results highlight the importance of immersion during training in general and in sensory modality relearning in particular. Implications for therapy and rehabilitation are discussed. Meta-analysis of the individual and combined predictive accuracy of the Allen Orthopaedic Classification System in distal femoral fractures. The Allen Orthopaedic Classification System (AOCS) is a standardized system for classifying distal femoral fractures. The purpose of this study was to determine the individual and combined predictive accuracy of the AOCS to predict major complications (malunion, nonunion, and/or infection) and to predict surgical treatment choice (internal fixation, hemiarthroplasty, and/or arthrodesis). A systematic search of the literature and the institutional fracture database was performed using the AOCS as well as the Smith and Jones major complications and treatment choice outcomes. The predictive accuracy of the AOCS as well as a severity index (the Smith and Jones criteria) was determined using  $2 \times 2$  contingency tables, odds ratios (ORs), sensitivity and specificity, and the area under the receiver operating characteristic curve (AUROC). The search yielded 882 titles and 100 full-text articles for review. The majority of the studies were retrospective reviews. The AOCS had moderate to high predictive accuracy for major complications, surgical treatment choice, and all AOCS categories, but a lack of evidence for the AOCS individual categories (AOCS 1-3). The Smith
