Is this your description? Please answer the following question. 6 answers Matching. Sign up for free. You can put down a user-submitted Note, which appears on your site with your name or a more-descriptive title, as a place where you can post about any content you write. Open the file or click the icon to your right to save your file as a HTML page. Email Address. So, you have a nice wordpress site with lots of money-making potential, you just need to be able to understand how to make money with it! Thanks for the post. Open the file or click the icon to your right to save your file as a HTML page. Open the file or click the icon to your right to save your file as a HTML page. You can put down a user-submitted Note, which appears on your site with your name or a more-descriptive title, as a place where you can post about any content you write. Open the file or click the icon to your right to save your file as a HTML page. Thanks. I needed this! Hi, I'm currently looking for a way to send emails to a specific group of people that I am using my web site to create. I have tried several times to use one of the suggestion from this post and it seems like the whole experience is not fully compatible with all the available email servers. I have a whole list of people in one table in a database. The number of people in the table is growing and I can not send emails to all the people I want at once. My main questions are: A) Can the original author of the post offer a cost effective way to send emails to a defined group? B) If the first question is not fully answered can someone recommend a way to send emails from an existing web site to a list of people in a table? Thanks. I need to figure this out asap. It might be a dumb question, but how are you using SendGrid to send emails? I thought that the "Email send" button on the Wordpress admin panel was for the server's native mail() function? I've been trying to find a solution that will work and cost effectively. Thanks for any help. You can also use mail() to send emails via the PHP mail() function. All you have to do is set the relevant mail server and the recipient
