The discovery occurred on the evening of May 31, the Consulate General of India said in a statement on Saturday. "The Consular Security Officer detected the device and alerted the United States Secret Service (USSS) who evacuated the Consulate, evacuated the staff of the Consulate and the Consulate General to the Department of State Bureau of Diplomatic Security. The USSS conducted an assessment of the Consulate building with the Bureau of Alcohol Tobacco and Firearms (ATF). The USSS and the ATF completed the assessment and declared the Consulate building safe. "At approximately 11:00 p.m., the USSS advised the Consulate that they could re-enter the Consulate building. In accordance with standard operating procedure, the Consulate General staff remained in the Department of State Bureau of Diplomatic Security's protective custody until the threat was removed. At 2:40 a.m. on May 31, the Consulate General resumed its regular operations and we are grateful to the USSS, the Bureau of Diplomatic Security and all of their incredible members for their hard work in ensuring the safety and security of our staff and the Consulate General staff and the safety and security of the community of Houston." "The disruption of the Consulate's regular operations was caused by a suspicious device," the statement added. A source, who preferred not to be named, said the device could have been a pressure cooker, but it was not confirmed. The Consulate General of India in Houston is the largest Consulate of India in the United States. United States has a consular relationship with India.--- title: What's next? toc: false --- If you have questions about website functionality or have feedback on what's next on the project

Kris Longknife Series books (1 to 7) A: The Kriscross Store is a one stop shop for ebooks for all of the Kris Longknife series. They are priced reasonably and their prices are accurate. You can add them to your cart or bookmark them directly. Q: C++ templates - Alternative to double switch statement? I have a question regarding the use of templates. I have code that looks like this: `template class MyClass { public: void foo(); ... private: template R bar(const R& r); }; template T MyClass::bar(const T& r) { switch(typeid(r).name()) { case "Double": case "Double2": ... break; case "Triple": case "Triple2": ... break; case "Quadruple": case "Quadruple2": ... break; default: ... } ... }` I'm wondering, is there an alternative to this switch statement? I don't think there is, as it is what is required for such a scenario. I am aware that I can create a second templated function, and then switch on the templated return type, but this seems unnecessary to me - would using `dynamic_cast` and typing out the name of the class be an option? A: I'm not exactly sure what you 2d92ce491b
