[free]. Insulin, glucagon, and proglucagon: in vitro dynamics of release by rat pancreatic islets. The dynamics of insulin, glucagon, and proglucagon release by pancreatic islets isolated from rats fed ad libitum, were investigated. Insulin release began within 2 min and maximum was achieved within 5 min of incubation at 37 degrees C in the presence of 2 mM glucose. The initial insulin peak was followed by a decline to a nadir. When glucose was omitted from the incubation medium, there was an immediate release of insulin associated with a rise in [Ca2+]. The rise in [Ca2+] was not associated with any significant change in the release of the other two islet hormones. The insulin response to glucose was not significantly altered when the islets were treated with dibutyryl cyclic AMP in the presence or absence of tolbutamide. After a period of quiescence (20 min), the release of insulin and proglucagon was increased. The proglucagon release was biphasic, characterized by two distinct peaks at 10 and 130 min. The glucagon release was monophasic. This study provides evidence for the dissociation of the release of insulin and proglucagon by pancreatic islets. "We have constantly heard concerns from the American people that we have to close, and I'm disappointed, frankly, that there was not more progress," said Lesa Jansen, a Democrat who has represented Everett and Snohomish for the past seven years in the Washington state Senate. "Let's get this done and get it done for the people." But instead of addressing concerns directly, the Democrat-controlled committee is passing on the bill to the full chamber. "The committee has found the bill's provisions to be consistent with their priorities, but further provisions need to be addressed," Senate President Phil Frankel, a Democrat
