The annealing temperature for the nanoparticle synthesis can be varied between room temperature and 300 °C, depending on the nature of the precursors. Additionally, the operating temperature of the reactor (on the order of 350 °C) influences the average size and the size distribution of the nanoparticles [\[1\]](#). The process for the synthesis of the nanostructured TiO₂- is as follows. Titanium chloride (TiCl₄-) and Titanium glycolate (TiO₂-G) are mixed at different molar ratios with the aim of obtaining a TiO₂-G sample with the lowest possible band gap [\[2\]](#). The mixture is heated at 120 °C for two hours, followed by hydrolysis at 140 °C for two hours. The solid product is ground using a mortar and pestle, dried at 110 °C for one hour and then annealed at 350 °C for one hour in air. 3. Results ===== To confirm the formation of TiO₂-G nanoparticles, the FTIR spectrum of TiO₂-G ([Figure 1](#)) [\[3\]](#) shows peaks characteristic of the characteristic bands of TiO₂-G: the vibration peak at 500-700 cm⁻¹ corresponding to the Ti-O vibration bond, the bending vibration of the Ti-O bond at 522 cm⁻¹ and the asymmetric and symmetric stretching vibration peaks of the Ti-O bond at 463 and 516 cm⁻¹ [\[4\]](#).
