Category:Video game trainers Category:First-person shooters Category:Windows gamesOntogeny and regulation of the olfactory system in pufferfish. The pufferfish is an ideal model organism to study the molecular and cellular mechanisms underlying neuronal development. New information on the ontogeny of the olfactory system of the pufferfish, *Tetraodon nigroviridis*, is presented here. In order to elucidate the sequence of olfactory gene expression and to study how the olfactory system develops, we isolated cDNAs encoding the odorant receptors from the olfactory epithelium of adult and developing *T. nigroviridis*. The ligand specificity of the receptors and their expression profiles during development showed that *T. nigroviridis* has a multigene family of odorant receptors that are expressed in a spatiotemporal manner. The expression of these receptors in the olfactory epithelium and sensory neurons during the early stages of development revealed a dynamic developmental pattern in which some odorant receptors appear first in the embryonic olfactory placode. The receptors that are expressed later in development are localized to the olfactory sensory neurons, some of which appear to be immature. The expression of these receptors in the olfactory epithelium was also associated with distinct subsets of axons that grow into the olfactory bulb of the brain 2492ce491b
