The site is This is what it says for Unlocking and. Re: Garmin Image Unlock - gimgunlock. Wed Dec 21, 2017 7:

Category: Unlock Software Category:Utilities for WindowsQ: Implementing callback-based asynchronous requests in Django I am trying to implement a function which uses a synchronous GET request but needs to return an asynchronous response. My current implementation looks like this: #get_response.py import requests def get_response(request, params): url = "" + params response = requests.get(url) return response And in my view.py def get_response(request): request.response['status'] = 'success' request.response.content = get_response(request, 'example') return HttpResponseRedirect(request.response) I want to change my view.py so that it looks like this: def get_response(request): request.response['status'] = 'success' request.response.content = get_response(request, 'example') return HttpResponseRedirect() What is the proper way to make the function asynchronous in Django? A: You can use the async HttpResponseRedirect from django.utils.asyncio. from django.utils.asyncio import HttpResponseRedirect from django.utils.deprecation import MiddlewareMixin class Middleware(MiddlewareMixin): def process_request(self, request): response = get_response(request) return response Then you can set this middleware on your views from django.utils.asyncio import coroutine @coroutine def get_response(request): ... And use it like this in your views: from django.utils.asyncio import coroutine from django.http import HttpResponseRedirect @coroutine def get_response(request): response = get_response(request, 'example') return HttpResponseRedirect(response.content) BTW this is the same as @HynekSavinkov's answer Southern Methodist University has warned students to be on guard after some student 2d92ce491b
