If you want to play a game, try searching it's name in the google play store, or on this site, and you'll find a link to the download page. The testing and testing of various materials is a well-known and widely practiced art. Test methods and apparatuses are developed and adapted, one for the other, as tests of the samples to be tested are implemented. One such widely used and well-known test method is the test method for ion conductivity, in particular a test method for electrical conductivity of samples to be examined, which includes the application of a potential across two electrodes disposed in a sample to be examined. With the aid of a current meter, a current flowing between the electrodes is measured and the potential difference across the electrodes is deduced therefrom. Measurement of the resistance of the sample by the application of the voltage leads to the conclusion that a conductivity exists in the sample if the measured resistance is lower than a predetermined value. The test method in particular for the electrical conductivity of samples to be examined is widely used in various areas of research and technology, in particular in the test of combustion gases. The test method is described in greater detail in U.S. Pat. No. 6,104,574 and in the references cited therein. In a test of the aforementioned type, the resistance measurement with the aid of the current meter is effected prior to the application of the voltage between the electrodes and takes a certain period of time. The sample to be tested is connected with the electrodes via a cable connection. In some applications it is desirable to avoid any cable connection between the sample to be examined and the electrodes. For example, in the tests of combustion gases it is desirable to test the sample without any unnecessary connection between the sample to be examined and the electrodes, because this would interfere with the analysis of the combustion gases. There exists therefore a need for a method of testing electrical conductivity of samples to be examined, which method can be performed rapidly, which can be performed without a cable connection between the sample and the electrodes, which method is reliable, and which is flexible in a variety of areas of application.
