While the book starts from the basis of hardbound research laboratory as the laboratory environment, it does not limit itself to laboratory laboratory as one can get the theoretical concepts from almost any part of the laboratory as the theory used here is almost for all the laboratory activities irrespective of laboratory type. The book starts with a **brief description of the laboratory environments** and the **types of tools and equipment** used in a laboratory environment. This will then lead to the theoretical concepts for the training of research technicians. After this, the basic tools and equipment are discussed and the required elements of laboratory activity are given. This is followed by **brief descriptions of the laboratory research** processes followed in different disciplines to provide an overall idea about the lab research work. This is then followed by the theory of **how research is carried out and why it is required** and provides a good theoretical basis to the laboratory technician. This part of the book deals with how experiments are designed to look for **what are the desired results** and how they should be tested. This part also looks at the **general principles of scientific method** and how **it works to get answers** to the questions asked. These principles are then put into practice to provide **how research is carried out** and this is followed by **a brief description of the uses of chemical laboratories**. A very basic understanding of laboratory equipments and tools is provided after the use of chemical laboratory. This is then followed by a **tutorial about the laboratory tools and equipments** and a very brief description of the laboratory instruments used to carry out a laboratory test. The focus is given to the electronic laboratory tools. This is then followed by a **brief description of the laboratory instruments** and their usage in the laboratory. After this, the laboratory is explained by a **brief description of a laboratory and its laboratory activity**, starting with a brief description of the purpose of a laboratory, followed by a brief description of the laboratory work and lastly followed by the important laboratory safety issues. This is followed by a brief description of the types of testing that can be performed in a laboratory. Part 1: The Laboratory Environment {#Sec1}

===== Introduction {#Sec2} ----- The laboratory environment consists of several different types of laboratories, which are designed to carry out different kinds of activities. These laboratories can be used for training purposes or for
