Category:AutoCADQ: How to programmatically get access to values inside a constructor? I want to ask a simple question about

Java. Suppose we have a class called Robot that has a constructor in it. The constructor takes 2 integers as arguments (robots.Robot(int n, int m)); I have a program that will run and set values inside the constructor. Now my question is: is there a way I can tell my class to have access to the values I tried Robot.Robot.n, and it gives me an error. Is there any way to do this? I hope this makes sense to you, thanks. A: Robot is a singleton. All instances of the class Robot share the same object. You cannot change the parameters from one instance to another. But you can get a reference to one instance, and do what you want with it. Robot robot = Robot.getInstance(); int n = robot.getIntParameter("n"); int m = robot.getIntParameter("m"); public static Robot getInstance() { Robot robot = new Robot(); robot.setIntParameter("n", 100); robot.setIntParameter("m", 200); return robot; } public int getIntParameter(String name) { return super.getInt(name); } public int setIntParameter(String name, int value) { return super.set(name, value); } The Islamic State has made gains in the Philippines a1d647c40b
