Effect on viral adsorption and the expression of cell surface receptors. Various preparations of commercial propolis have been tested for their effect on the interaction of cytomegalovirus (CMV) with cells and on the binding of virus to cells. The experiments were performed on BS-C-1 cells of African green monkey. Propolis of the European variety interfered with adsorption of the virus on the cell surface. The inhibitory activity increased with increasing concentration of propolis. It was found that the first step in the adsorption of the virus to the surface of the cells

appeared to be the interaction of the virus with the glycoproteins of the cell surface, since the effects on the interaction of virus with host cells were the same irrespective of the route of administration. It was found that, without any impairment of the degree of biosynthesis of glycoproteins of the plasma membrane, the total number of binding sites for the virus was reduced. This was done by means of an immunofluorescent technique that allows the quantification of the number of binding sites of the cells on the surface of the cell monolayer. The inhibition of CMV binding and the inhibitory effect of commercial propolis were also observed in the presence of sucrose. Growth of RF energy to tissue at high power is limited by the heating of intervening tissue and by the amount of thermal energy that is lost to heat conduction to tissues around the patient. A better understanding of the mechanisms behind the interaction of RF energy with tissue is needed to better control tissue temperature and avoid complications from thermal damage to intervening or neighbouring tissue. Pigmented lesions are most frequently treated with lasers because they are accessible to visible light, although there are exceptions to this. The lack of light penetration in deep tissue, particularly in the skin, creates a larger treatment volume than is desirable and limits the effectiveness of therapies. In addition, there are considerable histological changes to cells in the skin and subdermis due to thermal treatment 55cdc1ed1c
