With the release of AutoCAD 2014, the application is offered as either a standalone version (which requires a copy of AutoCAD itself) or as part of the AutoCAD (desktop app). Both standalone and AutoCAD software products, except the Autodesk Exchange Edition, have been generally available since 2010. AutoCAD uses DWG (drawing) format files as the format for its native files. AutoCAD supports DWG, DGN, DXF, and SGI image formats, and the native DWG and DGN formats. However, the native AutoCAD file format is in reality a DGN file containing a data block that contains the rendering data. This process is accomplished with an automated tool called BlockSave, which replaces the metadata of the native file with metadata that can be recognized by other applications. Autodesk's commitment to AutoCAD is substantial. In addition to the software itself, Autodesk makes significant contributions to AutoCAD's codebase through its regular releases of patches and updates. This guide is intended for AutoCAD users who are not software developers. It is not intended for Autodesk product developers and programmers. Some of the commands, options, and features discussed in this guide may be different in older versions of AutoCAD or in other software applications from Autodesk. The association between tuberculosis (TB) and foods has been known for centuries. For example, milk and vegetables are thought to be the causes of pulmonary TB in humans, and many researches were conducted for more than two decades. At present, TB can be caused by a variety of mycobacteria and all cases of pulmonary TB are caused by one of two species: Mycobacterium tuberculosis and Mycobacterium bovis. Bovine TB can be caused by M. bovis, Mycobacterium avium subsp. paratuberculosis, Mycobacterium avium subsp. avium and Mycobacterium avium subsp. silvaticum. There are differences between the susceptibility of humans and cattle in the pathogenicity of the TB bacteria, the TB infective dose and the ability to be transmitted between individuals. Currently, TB is one of the most important infectious diseases in the world, and the prevalence is increasing year by year. Food and water, environmental and socio-economic factors and human behavior play important roles in the pathogenesis of pulmonary TB. To understand the relationship between TB and foods and to prevent the recurrence of TB, we need to conduct scientific and effective research on the association between TB and foods. In this review, we summarize the research progress of the association between TB and foods in the field of food microbiology, and discuss the advantages and disadvantages of the researches.
