Q: How to get the best performance out of in-memory databases? I've been learning and testing out using in-memory databases in Java and have run into a few things that have made me scratch my head as to how they can be best used. I would like to

create an in-memory database with the following components: It needs to be persistent, so I can have multiple threads updating/deleting elements in the collection without all of the updates/deletions getting held up in a single thread. I would like it to be a tree (List or Set is fine, but I'd like the ability to define the order in which items are added and the ability to specify a strict ordering) I'd like the option to query what's in the collection at a particular time I've seen the many ways you can implement a tree in Java, and I can't decide if that's what I want. I could, for instance, create a Map of Lists of Items and then a Map of Collections of those ListMaps. A good solution would let me query which items are

in the collection, in what order they're in, and for the items' contents. I think this can be done in more than one way. Does anyone have any suggestions about what would be a best practice, and which aspects would be best to handle manually (to avoid some overhead) and which would be better left to the database engine to handle? A: I would suggest SQLite. It's available for Android and is very fast (see below). It has a simple syntax for creating in memory tables, a great feature that allows you to query the tables without having to create a server-side query. You can use it for anything you would like to persist in the database. All you would need is to create a file on the classpath and it

will create the database and tables for you. The last time I needed a local

Markup Assist: Automatically create the most efficient and cost-effective route through your designs, including route orders. By strategically placing orders on specific layers, you can increase the number of orders placed and save a lot of work. (video: 1:55 min.) A new query filter feature enables you to view only what you want, without the clutter. (video: 1:21 min.) Accelerate your design process: Dynamic cursor support: Automatically update the cursor for the current drawing element, so you

never have to manually move the cursor. (video: 1:08 min.) Improved brush and freehand tool support: Support for all major brush types: Create a multitude of custom brushes for your drawings. The new Live Brushes feature even lets you see the brush preview as you draw, no more guesswork. (video: 1:49 min.) Add simple text to your drawings without the need to search or copy and paste. (video: 1:28 min.) Greater control over the drawing experience: Suppress the annoying unwanted messages that keep coming up during drawing sessions. When you turn off the messages, you don't have to worry about them any longer. (video: 1:01 min.) Keep your workflow free from distractions: New interface:

You can even toggle between drawing modes by just pressing Enter. (video: 1:02 min.) The feature list is just the beginning of what AutoCAD 2023 has to offer. Make sure to check out the new features in detail, as we'll continue to cover them throughout the release. New Ribbon and Layout Features New features in AutoCAD 2023 include:

Layout improvements for better alignment and object visibility: With the improved line display that is now available in Drafting & Annotation, you can see just where your alignment markers and line ends are located
