KeyMacro is an advanced keystroke logger for Windows operating systems, providing a simple method to spy on others when they are working on their computers. With KeyMacro, you can record all the keys pressed on your target computer, no matter if the recording software is run as a background process or a form of malware. A keylogger is defined as "a piece of software or hardware that can record what a person or computer is doing on a computer or other electronic device." KeyMacro is a well designed user-friendly application that makes it easy to create a keylogger for Windows and hide it from the user. KeyMacro is capable of recording all keystrokes and mouse movements from other computers on your network, which makes it easy to see the person's web surfing or documents being edited. KeyMacro provides the features of most other keystroke recorders, including a user-friendly interface and automatic update, plus a lot of options and functions for customizing its look and feel. KeyMacro also lets you record the WinLogon (Windows Logon) events that occur when the computer starts up, login and logoff. KeyMacro doesn't need a password to access any computer on the network, and doesn't slow down the computers or the network. KeyMacro records keystrokes and mouse movements by using the keyboard and mouse drivers, which requires no changes to the target machine. KeyMacro provides a wide range of ways to run it, including a command line or a GUI. The application can also run in background mode. You can hide the recording window, show a tray icon or create a scheduled task. You can configure the settings to start or stop recording, and you can view the logs in various ways, including a text-based format, the sound format or in a specified format. You can also export the logs and hide the window. The logs can be imported into other programs, including Notepad. KeyMacro offers the following features: 1. Automatic update - it allows you to schedule automatic updates. 2. Trusted Mode - it allows you to send macros to other computers that are identified as trusted. 3. Multilingual support - it supports many languages. 4. Kill keystroke - it can stop recording a specified keystroke. 5. USB and network logging - it can log keystrokes and mouse movements through USB or the network. 6. Logs in various formats - it supports the text, sound and SQL formats 1d6a3396d6

I have an XML schema that contains attributes and I want to add validation to ensure the names are not only not illegal XML attributes, but also are not reserved words in a language such as JavaScript or Java. I've looked into using a xsd:restriction and xsd:key to do this, but they seem to be only for the attribute types, not the attribute names. What is the most common way of validating attribute names? A: There are a number of ways to validate attribute names in XSD. The simplest is to use a disjunction: This can be enforced by a simple condition such as Not a valid attribute name A more sophisticated technique is to use the XSD built-in conditional type, as you suggest. Here is the relevant passage of the spec (section 7): [13] The xsd:simpleType value contains two attributes: a fixed set of values that can be represented by this type, and a fixed set of structural constraints that must be applied to values assigned to attributes of a type. ... 13.2 Structural Constraints: [13.2.1] There is a fixed set
