Advanced Startup Manager can be used to quickly launch a program or Internet connection. Advanced Startup Manager supports all Windows 2000, Windows XP 09e8f5149f

Advanced Startup Manager (Final 2022)

Advanced Startup Manager is a handy tool for managing Autorun (Autostart) sections and associated settings in the Registry. The program easily lets you manage programs, folders, or network locations that should be launched automatically, when Windows boots, or after rebooting system. Advanced Startup Manager allows to either run an application directly after Windows starts (set up with autostart type: boot), or launch an application after rebooting Windows (set up with autostart type: post-boot). It supports setting up startup priority for the programs you wish to launch at boot or after booting. It lets you configure shortcuts (launchers) to quickly launch common items, and customize them to fit your preferences. Advanced Startup Manager lets you conveniently manage the programs that should run when Windows boots, as well as the ones that should launch after Windows boots. It supports changing programs' startup priority and providing shortcuts for launching the preferred programs. Advanced Startup Manager lets you launch programs, folders, or network locations by using the following startup types: Autostart - the application will run right after Windows starts. Post-boot - the application will run after Windows has booted. Uninstall - removes autorun sections associated with the application, but does not uninstall the application itself. To add an autorun to the list, create a new autostart entry and specify the location of the shortcut, drive letter, path, and type of autorun you wish to use. Advanced Startup Manager allows you to set up autorun elements using a number of different startup types. For example, to launch Internet Explorer after you boot the computer, you'd use an autostart item that points to "C:\WINDOWS\explorer.exe" and to type "autorun" in the autostart dialog box. You can also launch an app at boot time. You do this by specifying the location of the shortcut, a drive letter for the autorun target, and the command you wish to execute. To protect the registry from accidental damage, the utility provides several precautions: Advanced Startup Manager uses "Preview" mode when adding items to Autorun list. Enables default settings for shortcuts that use item type "Specific". The program can not edit the Autorun section when editing it is disabled. Advanced Startup Manager also offers a user interface editor for registry items. In that mode, you can easily modify registry entries

What's New In Advanced Startup Manager?
