The Industry Partner Development Group (IPDG) made the first move in this direction with the development of the 3GPP MP4 file format. MP4 is designed to deliver media in a file format based on the ISO base media file format ISO/IEC 14496-12. A list of IPDG initiatives are listed on the 3GPP Website. The IPDG initiatives have evolved from the AC-2600 standard (a.k.a. 3GPP2) that was developed by the 3GPP working group 1 video and a.k.a. 3GPP working group 4, which was later renamed to 3GPP working group 6. The 3GPP MP4 file format is designed to provide 3GPP Multimedia content over 3GPP networks. However, in order to be backwards compatible with existing content distribution infrastructures, the MP4 file specification also provides a mechanism for storing 2G data encoded in the 3GPP TS 26.448 specification in a subset of the MP4 file. The MPEG-4 TS box format is used as an implementation mechanism to store the 3GPP TS 26.448 specification into the MP4 file. The box format can be used to identify and encapsulate content in the TS track. The TS box format is defined in the ISO/IEC 14496-15 specification. While the use of the box format to encapsulate 3GPP TS 26.448 into MP4 files is a mechanism for providing backwards compatibility with legacy content distribution infrastructures, for 3GPP content distribution, 09e8f5149f
