add an unlimited number of records, associate them with each other, give them keywords for fast retrieval, display multiple databases at once, link your images to a database, view your images in any size, and create thumbnail images for printing, emailing, bookmarking, and organizing by keyword. pixelCAT scans your collection, generates a database record for each of the files, and gives you a unique ID for every file. So you can get your digital collection organized right away. There are two separate actions within pixelCAT: a "Scan" action to gather your digital pictures, and a "Retrieve" action to link the keywords, descriptions, and locations to your images. pixelCAT only links your digital pictures to one database at a time. There is no way to link all of your image files to a single database. You can easily link different databases or collections to different database records. You can also link your images to a database record multiple times. For instance you may create one record for your personal collection of 'Clipart' images, and another for your Civil War database, and another for your 'book pages' database. Download a 30 day Trial (unlimited) version to see if pixelCAT is a tool that will be useful in your business, or for personal use, or both. Built-in editing tools: Image conversion Image scaling Image rotation Image bookmarks Image labels Copy/Move/delete images Change display properties for images Reverse the display direction of images Change the display direction of rows and columns Change the background color of rows and columns Print a document containing an image as a part of it View source code of an image Pick an image from one of the databases Upload an image to the database An easy-to-use interface makes locating and editing an image a snap. Views include tabbed display with adjustable font sizes and line lengths; and search index. An advanced database query feature makes finding images with filters or search terms easy. A relational database is comprised of a "base" which contains the information about the other images and the "links" which describe what the base links to. A record is a logical pair of a base and a link. A database manager and a search program can then be used to navigate the collections and search the databases using advanced queries. Links can be assigned keywords which can then be used to search the databases. This allows all of the images within a collection to be searched together. The database manager provides a very easy interface with intuitive icons for adding and deleting images. The table structure can be made to resemble any collection of images. Each new record can be given a date, name, description, and keywords. The database features a powerful image viewer with a searchable index. The images can be displayed at varying sizes. Connecting digital images to databases is easy. Using the database, it is possible to view, convert, search and link a great number of image formats: GIF, JPEG, TIFF, BMP, PNG
