It's a fork of unibootstrap (which was a fork of uniboot). It's used to boot a number of different distros. It also has good ISO support, but has no USB support. Fine-needle aspiration biopsy and related cytologic techniques in the diagnosis of breast disease. Fine-needle aspiration biopsy (FNAB) is a well-established method of evaluating a variety of breast lesions. There is, however, a paucity of literature on the sensitivity and specificity of FNAB for breast disease. Over the last 12 years, 117 cases of breast FNAB were performed and correlated with surgical biopsy or histology in an attempt to determine the accuracy and limitations of this technique. Of the 117 cases, 57 were performed on palpable breast masses, 45 on mammographically-detected masses, and 15 on breast cysts. A clear cyst aspirate was considered indicative of benign cytology. In the remaining 27 cases, the material was considered inadequate for diagnosis, as dictated by the cytologist. The overall diagnostic accuracy of the study was 89%. Diagnostic accuracy decreased with increasing degree of atypia and for palpable breast masses (91%) compared with mammographically-detected masses (86%). Compared with histology, the accuracy of FNAB (88%) was significantly lower than the accuracy of mammography (98%). FNAB has a relatively high specificity, and a large majority of palpable breast lesions were benign. Diagnostic accuracy, however, was significantly lower than that reported for mammography, and fell to 88% for masses that were mammographically detected. These findings may be due to the increased sampling error (i.e., cellularity) and lower sensitivity of the FNAB, as compared with mammography.Data is increasingly important to companies. The data is often stored in a database or other database-like system. The database systems often provide one or more tools to manage data. These tools may include database management systems (DBMS), database developers, 80eaf3aba8
