Introduction Let's be honest. "Quickly" is the best way to describe the Appcelerator Studio SDK. There are many other SDKs out there that also allow you to make native applications for the iPhone, Android, BlackBerry, and other platforms. However, Appcelerator has taken all of these platforms and created a product that makes the Quickly experience accessible for you. This book will show you how to leverage Appcelerator's powerful cross-platform SDK to create and deploy your first application for iPhone OS. Getting Started First, you need to download the Titanium Studio application from the Appcelerator site. Once you have installed the application, you can start creating your first application for iPhone OS. To do this, you can use either the IDE or the Titanium Command Line Interface (CLI). Since we'll be using Titanium CLI, you should first grab yourself a developer account from the Appcelerator site. Once you have your developer account, you will be able to use the CLI to build and deploy your app. To use the CLI, you need to have the CLIs that you would need to run in Mac or Windows. Let's take a look at what is available to you: In Mac OS X: You can use the CMake build system which allows you to build applications. Or, you can use the GNU Make build system if you prefer. You can build applications using the Android build system. If you need to build for BlackBerry, you can use the Windows build system. For new applications, it's recommended to use the CMake build system. If you plan to have your application deployed to the App Store, then you will need to use the Xcode build system. Titanium SDK The Titanium SDK is an SDK which allows you to build applications which run natively on a iPhone, Android, or BlackBerry.
