The acronym of the tool stands for "Making case tool in Microsoft Excel." While a lot of people would associate the tool with an add-in, MCTOOLS is actually a command line tool that is designed for users who have any of the localized versions of Excel installed on their systems. MCTOOLS allows users to make changes to the case of the letters within a selected range and then convert it to the specified text. It is not a desktop application, but rather a command line utility. This is why we can guarantee that it does not affect the functionality of the base excel application. ImportExcel Addin Features: The tool also allows you to sort and filter the existing content on Excel spreadsheets. The following are the features MCTOOLS has to offer: 1. Delete all blank spaces and convert them to a single space. 5. Convert all uppercase letters to lowercase. 6. Convert all lowercase letters to uppercase. The tool can be downloaded and installed by following

The parasite must have been present in the environment prior to the emergence of Homo sapiens. While the route of transmission remains undetermined, infection typically occurs via ingestion of raw or undercooked contaminated meats and unpasteurized dairy products. While the risk of transmission through the placenta during pregnancy is well-documented, the incidence of congenital infection is high. T. gondii can be acquired after birth, resulting in outbreaks in nurseries and other social settings. As a result of the prevalence of congenital infection, the annual cost of hospitalizations and treatments for congenital toxoplasmosis is large. We propose a strategy to identify host-pathogen interactions that promote parasite dissemination from the intestine, specifically in the developing central nervous system (CNS). We will use a novel method for analyzing and visualizing the repertoire of expressed proteins in the developing mouse
