The program supports weighted average and where the range contains only integers (or the number is a constant). The output is a range that contains the standard error for each number in the range. The output can be used to calculate the standard error of the mean for the entire range. Some of the features include: It supports range = [min, max] It calculates the standard error based on population standard deviation It supports weighted average It can easily calculate the standard error for the entire range Macro Description: This macro is used to add a new formula field to the table that will calculate the standard error of the mean based on an array of numbers in a range and based on the distribution of the average and standard deviation. - Presentation: Standard Deviation Calculator app provides you with an intuitive application that can be used for determining the standard deviation of a set of numbers. Two different options are available: population standard deviation or population sample. Users can add as many values to the list as they want and the standard deviation will be calculated in an instant. - Input: Standard Deviation Calculator app uses only numeric values inputed to the field. - Output: Standard Deviation calculator shows two options: for population and sample values. The values which are calculated can be displayed in any format, such as a list, chart or table. - No internet access: Standard Deviation Calculator is completely offline application, therefore it can be used in any situation where internet access is not available. - High precision: Standard Deviation Calculator has great precision and can be used for many decimal points. - Use Widget: Standard Deviation Calculator can be embedded to any app. - User friendly: Standard Deviation Calculator is user friendly and intuitive application. What's New in This Release: Fixed a small bug in the app, which prevents inputing a single number to population sample. Thanks for your feedback!Bringing together the Model III and the MK III, the Model IV adds an electrically controlled variable handlebar. The handgrip on the handlebar can be tightened using the mechanical knob, as well as loosen using the electrically controlled knob. The knob can also be turned off completely. The motor is always turned on, so the handlebar can be loosened using the electrically controlled motor, as well. The Model IV has the ability to select speed in half-steps (e.g. from 1,800-2,500 rpm), as well as a continuous speed setting from 1,800-2,500 rpm. The Model IV can also be controlled by a wireless remote. A stainless steel chain hoist can be used to lift heavy or awkward loads such as bulky bags, bikes, etc. Other features include a reverse setting, as well as a full range of speeds from 1,800-2,500 rpm. A gear indicator shows what gear the bike is currently set in. The gears available are 1-2-3-4-5-6-7-8-9-10-11-12. All of these features are controlled by the "4 Speed controller" located on the handlebar, as well as
