Complex patterns in the organization of the human brain is a novel human subject. It's been extensively studied by neuroscientists trying to unravel the links between brain structure and function. However, these studies usually focus on the "big picture" organization of the whole brain, aggregating data across a wide range of species and subjects. Neuroscientists are interested in a more "local" level, focusing on the small-scale structure of individual brain areas and how the brain areas are organized into functional networks and pathways, which contributes to the overall function. Researchers have observed that the human brain is composed of a number of distinct regions that appear to be necessary for function; cognitive behaviors such as attention, perception, language and reasoning depend on certain brain regions' activity, while some other regions seem to be "silent". In other words, if you cut up a human brain and analyze the pieces, there might be a lot of crazy patterns. This is a special issue of Frontiers in Neuroscience that looks at the "crazy patterns" observed by scientists. Crazy patterns in the human brain In this special issue, diverse research teams delve into the organization of the human brain by tackling some of the research questions in these complex regions: • Topology and organization of the human amygdala, a brain region involved in fear response • Organization of the human inferior frontal gyrus (Broca's area), a brain region involved in language • Organization of the human posterior cingulate and medial parietal cortex, a brain region associated with different aspects of cognition such as attention, perception
