SharePoint Site Migration Manager (SSMM) is a stand-alone tool for SharePoint site migration. It transfers SharePoint sites between servers without creating new sites on the destination. This is the key to migrate large number of sites easily. SSMM can migrate multiple sites in a single run and it is the ideal tool for migrating SharePoint sites. As SharePoint site migrations between different server are very common, SSMM is an ideal tool. The migration is performed in two phases, i.e. site content copying and site metadata mapping. After the migration is finished, the copied site metadata is refreshed automatically. SSMM includes several built-in scenarios like up-to-date SharePoint migration, site collections migration, various sites migration, and even Microsoft Office SharePoint Migration tool migration. SharePoint Site Migration Manager supports SharePoint site migration from Microsoft SharePoint Server 2003 to Microsoft Office SharePoint Server 2007 and back, and it supports both Windows SharePoint Services (WSS) and Microsoft Office SharePoint Server 2007. Key Features: The user interface is extremely simple and intuitive, and it is well aligned with the Windows operating system. SSMM is perfectly compatible with a variety of Windows operating systems and it is easy to use. This program is designed to make the migration of SharePoint sites between servers quick and easy. SSMM will automatically transfer and restore SharePoint site content from a source server to a destination server. The content and data are automatically copied in both environment. Site owners can be notified via email if a site is not synchronized properly with another server. The migration of SharePoint sites is based on the content and content alone, and it does not require the system administrator to manually edit data records in the database. SSMM will handle the migration of content and content alone. It will copy both content and content alone to the destination server. Metadata mapping is just an optional service, which can be used to link the source site to a destination site, or to the destination site where the copied site content has already been stored. SSMM uses the built-in SharePoint content checker to analyze the content and metadata of the site. It can distinguish between individual site content and site contents. The content checker can be used to compare the source site with its mirror site on the destination server and notify the user if content of the destination server differs from that of the source server. The user interface is intuitive and simple and it is easy to learn. SSMM can learn the structure of your source
