The rapid and deep sequencing technologies used to generate sequence data will influence many fields, including crop genetics, where analysis of plant genomes is now routine. Recent studies have successfully applied these technologies to peanut, a globally important and model legume. Whole-genome sequencing of diploid peanut (A) genomes revealed that the A genome has a high content of simple repeats, which have resulted in increased sequencing difficulty. To facilitate peanut genome assembly, over 500,000 single nucleotide polymorphisms (SNPs) were chosen to design an analysis pipeline that generates phased haplotype blocks from either parental A or B genomes. The resulting map was used to construct linkage groups, which corresponded to existing linkage maps, enabling genome annotation. Additionally, at least 50% of the peanut nuclear gene space was covered, with 50,000 (AB-genome) and 10,000 (A-genome) expressed genes predicted. This article represents an important step forward in the computational biology of peanuts.Q: How to load multiple version of javascript file I am trying to load multiple versions of the JS file and I am confused why my code is not working index.html
