1. Field of the Invention
This invention relates to a folding, collapsible picnic table and, more particularly, to a collapsible picnic table that may be carried to a desired picnic location and erected for use in a self-contained manner.

2. Description of the Related Art
Picnic tables are used at a variety of locations. Typical picnic tables are constructed from solid materials such as wood, metal, or concrete and are generally of a permanent nature. As such, these tables are not easily moved from one location to another. In recent years, it has become more and more popular to use portable picnic tables. The most popular portable picnic tables are collapsible tables that can be folded and carried in the trunk of a vehicle. The collapsible feature permits the picnic tables to be more easily stored when not in use. This reduces the storage space needed when the tables are not in use. Additionally, the collapsible tables are easily moved from one location to another. However, even though collapsible picnic tables have become more popular, they have not become widely used. One reason for this is that the construction and folding of the typical collapsible picnic tables is rather complicated. For example, the legs of the tables are generally mounted to folding structures that are configured to be folded against the table tops. The complex folding structures can be difficult to operate and can result in an expensive table. In addition, it can be difficult to properly orient the table legs when the table is being assembled. Improper leg orientation can cause the table to be unstable. As such, portable picnic tables must be folded and assembled in a manner that is both easy and secure. Accordingly, a need exists for an improved collapsible portable picnic table that is easy to operate and assemble, and that is stable once assembled.
