The ExcelDocument component deals with the ExcelDocument instance and its methods and properties. An ExcelDocument object is what you will see in the Excel application window when you open a workbook. The ExcelDocument is the main Excel object that takes care of opening/saving a worksheet and its workbook. The ExcelDocument has two attributes: \* Application: The ExcelDocument is identified by a Application attribute. \* Workbook: The ExcelDocument is identified by a Workbook attribute. The ExcelDocument should always exist in memory. During the instantiation of the NativeExcel suite, one can choose one of two flavors. Either the application is given the standard workbook (Workbook=1) or it is given a custom workbook (Workbook=0). In the standard case, the workbook is of type ExcelWorkbook, which is a descendant of ExcelDocument. In the second case, the workbook is given a custom type, in this case, ExcelWorkbookRef. The ExcelDocument has the following methods and properties. \* \* \* \* Methods \* \* \* \* DoSomething...() This method is called upon any action you perform on the worksheet/workbook that you are working on. The default action is to call one of the methods/properties that we have just discussed. For example, the ExcelDocument has the following methods for adding, moving, copying, and deleting rows, columns, and cells: \* DoAddCell() \* DoAddCellColumn() \* DoAddCellRow() \* DoAddCellTable() \* DoDeleteCell() \* DoDeleteCellColumn() \* DoDeleteCellRow() \* DoDeleteCellTable() \* DoInsertCell() \* DoInsertCellColumn() \* DoInsertCellRow() \* DoInsertCellTable() \* DoMoveCell() \* DoMoveCellColumn() \* Do
