[The protective effects of the Ca²⁺ channel blocker diltiazem on gamma-irradiation injury of the lung]. To observe the protective effect of diltiazem on lung injury following irradiation. Sixteen SD rats were irradiated with a single dose of 10 Gy gamma-ray. Rats were divided into two groups: diltiazem group and control group. Rats in diltiazem group were given a single dose of diltiazem (10 mg x kg⁽⁻¹⁾) by intramuscular injection before irradiation. Rats in control group were given the same dose of saline at the same time. Survival time of rats in both groups were observed. At 24 h after irradiation, the bronchoalveolar lavage fluid was obtained to detect the cell apoptosis, superoxide dismutase (SOD) and malondialdehyde (MDA) activities and lung tissue was obtained to detect the permeability of alveolar-capillary barrier. There was no significant difference in survival time between diltiazem group and control group (P>0.05). Compared with control group, the total cell number of bronchoalveolar lavage fluid in diltiazem group decreased significantly (P
