Three-dimensional (3D) models of the atrium can be used to analyze atrial fibrillation (AF) and development of a new ablation strategy. A 3D model of human atria was reconstructed from computed tomographic (CT) images using a unified segmentation method. The 3D atrial models were validated by comparing electrophysiologic data with previously reported data from human atrial myocardium. Ablation was performed in a 3D model in which the specific mechanisms responsible for AF were modulated. The 3D model accurately simulated human atrial electrophysiologic features. The main results of this study are that: (1) the dominant mechanism of AF is rotational around the left superior pulmonary veins (LSPVs) and (2) ablation at LSPVs successfully ablated AF in the 3D model. The dominant mechanism of AF in humans is rotational around LSPVs, and pulmonary vein (PV) ablation successfully eliminated AF. These data suggest that PV isolation of LSPVs can be effective therapy for patients with AF.In a conventional liquid crystal display device, the main operation of an active matrix type liquid crystal display is a time division system. The time division system divides one field of an alternating current (AC) signal supplied to the liquid crystal into a display period for displaying a screen, and a non-display period. The display period of the screen is controlled by a timing controller of the liquid crystal display. The timing controller uses a dot clock signal of a liquid crystal panel for the display period. However, since the liquid crystal panel uses a plurality of dot clock signals, a phase and a frequency deviation among the dot clock signals generated in a panel manufacturing process occur. The liquid crystal display device having such a problem needs a compensation circuit for correcting a display operation to be performed, according to a phase and a frequency deviation among the dot clock signals. The compensation circuit compensates for a delay error of each dot clock signal generated in the liquid crystal panel, and corrects the display operation to be performed in accordance with
