Mycobacterium avium subsp. paratuberculosis is the causative agent of Johne's disease in ruminants. This intracellular bacterium has numerous cell envelope constituents that have been investigated as potential targets for the development of novel anti-mycobacterial drugs. Bacterial lipids have been the focus of most of these studies, but only recently has the attention of researchers shifted to the polyketides. We have identified a putative polyketide synthase in the glycosyltransferase family from M. avium subsp. paratuberculosis. This was done by using the genome sequence of M. avium subsp. paratuberculosis to identify open reading frames with
