Pixus is a lightweight software application whose purpose is to help you use a ruler for measuring the distance of different objects displayed on your screen. The program comes in handy especially when working with CAD tools or other graphic editors where you need to measure distances precisely. It sports a clean and intuitive layout that allows you to perform most operations with minimum effort. Pixus displays a vertical and horizontal ruler, and lets you change its size by simply stretching the main panel. It offers support for both mouse and keyboard actions. What's more, you can move the ruler to any area of the desktop, and make the utility run at Windows startup. Plus, you can set the tool to remain on top of other applications, and this proves to be pretty useful especially when working with multiple programs at the same time. Since it doesn't require much computer knowledge to work with Pixus, even less experienced users can master the process with just a few clicks. Other notable characteristics worth mentioning are represented by the possibility to choose between several preset size modes and change the layout of the tool by selecting from various themes. During our testing we have noticed that Pixus carries out a task very quickly, and no errors showed up throughout the entire process. It leaves a minimal footprint on system resources, so it doesn't burden the overall performance of the computer, nor interfere with other programs' functionality. As a conclusion, Pixus offers a simple yet powerful software solution for helping you perform desktop measurement operations. The intuitive layout makes it an ideal application for beginners and professionals alike. Download Pixus software We are using cookies to give you the best experience on our site. Aim of this study is to explore the potential usefulness of the Tachypnea Index (TI) in the diagnosis of acute pulmonary disorders. The study population consisted of 140 adult patients. We studied the value of the TI in the diagnosis of different acute pulmonary disorders: pneumonia, influenza, and asthma. Sensitivity, specificity, and positive and negative predictive value of the TI were calculated in each disease. The positive and negative predictive value of TI were higher in pneumonia than in the influenza. The higher value of the positive predictive value in the pneumonia could explain the higher use of the TI in this disease. However, TI could be also very useful in the early diagnosis of influenza. In conclusion, the TI could be a useful tool in the diagnosis of pneumonia and influenza.Incidental detection of ovarian teratomas with whole-body magnetic resonance imaging.
