ProductSales3M Grafoplast Si2K Identification System Thermal Transfer Printer... The 3M Grafoplast Si2K Identification System provides efficient and A. The 1.2 Software Mod. changes to a copy of data from a harddrive with the. install the SIMPLO HIP Software.Q: adding application specific setting to all registered devices In a windows 7 application I have a setting that defines some audio options for the application and a broadcast receiver that listens to changes made to this setting. But this setting is not available to all devices, I only want to broadcast changes to registered devices. How can I do this? A: You could check how the settings framework works (part of the UserProfile application programming interface). In this app it gets its settings from a.INI file. This file is the configuration information for the application, and each user has its own set of.INI files that may be stored on a network drive or the user's computer (the app is not installed). The name of the.INI file is store.ini on the user's computer and has the same name as the.EXE on a distributed installation, with Store.ini on the local computer instead. After a restart, Windows will go through and read these.INI files to find the defaults. You could put a copy of your settings in one of these.INI files, or add a switch/action in the installer (you might not need a.INI file for this, as I said above). You can use a FileSystemWatcher to check for changes to this file and broadcast the setting as you would any other setting. So why does this work? The reason is that.INI files are not just for Windows Vista and Windows 7, but are actually a part of the Windows platform (again, part of the UserProfile). Microsoft has made it easy to create.INI files, and also named them *.INI. On the user's machine, all.INI files in the current directory are read, and any settings inside will override the ones in the store.ini. It can be a pain, though, to get the settings to go to the "right" place. Also, any change to another file (outside of the current d
