8/9/2007 [Henka] Hanshoku Biyori (Dragon Ball).rar Färreinspirerade Bakterier- und mikrobielen Bevölkerungsmaße (Empfehlungen für der medizinische Onkologie) (Sprache: Deutsch). water supply and the economy in developed countries. In developing countries, especially in rural areas where water supply is limited and where agriculture is the main economy, this is especially important. The future rate of water evaporation is likely to increase at a much faster pace than at the present. Given that we will need water for food, medicine, agriculture, industry, transport, irrigation, energy, housing and the environment, increased use of water is inevitable. This article reviews the effects of water and air pollution on the health, the economy and the environment, and indicates that most environmental problems will be addressed by the water and air pollution sectors. Health and the environment in global perspective ===== The environment and health are complex, multi-faceted and global issues. An understanding of the link between water and air pollution and human health is essential to the sustainable development agenda. From the perspective of global health, the actual sustainability of the water and air pollution sectors will be difficult to achieve unless an effective mechanism is put in place to effectively manage and control environmental pollution. In developed countries, the air pollution problem is receiving attention, but the health burden from water pollution is only now starting to be addressed by the regulatory authorities. Consequently, the economics of water and air pollution are not well understood and there are few accurate estimates of the health effects of human exposure to pollutants from water and air. From the perspective of the global environment, many of the problems caused by the water and air pollution sectors are global in character, and global solutions must be sought for them. More information is needed on the environmental effects of these pollutants on global biodiversity and habitats. Also, the future rate of anthropogenic increase in environmental pollution is becoming of increasing concern. Health effects from water and air pollution ===== In the short term, water and air pollution may affect human health by causing respiratory illnesses, such as acute bronchitis and pneumonia, chronic lung diseases, and eye diseases. In addition, water and air pollution may cause malnutrition in the short term, and chronic diseases, such as cancers, in the longer term. Also, water and air pollution may damage
