What the Pros Say About Photoshop The following artists have made it clear that they use Photoshop for manipulation in their work. "The original version of Photoshop brought editing into new territory by bringing computational photography to the masses. Now this formula is being applied more broadly as production systems become more powerful, eliminating 'house look' as a requirement for quality," says Alvin Faraday, founder and principal designer of Toygun, a creative agency based in Cambridge, MA, that offers branding and production services. Faraday adds, "Photoshop is the standard tool for post-editing, color manipulation and a visual statement. It also provides a means to enhance a print or a web image, as well as to provide a visual effect in a video. Its wide use is also a testament to its strength as a language of image production." Alvin Faraday Toygun www.toygun.com 4. Audacity Free • Audacity is a powerful open-source audio editor. It allows you to create, edit, and manipulate sounds and then save them to a wide variety of audio file formats. A few of the file types you can save to are MP3, WAV, Ogg Vorbis, and AAC. You can also edit and manipulate sound files by adding sound effects, adjusting sound volume, and mixing the two. It can also be used for video editing, which makes it one of the programs best suited for a designer's toolbox. It is open-source software available for Mac, Windows, Linux, and other operating systems. What the Pros Say About Audacity "Audacity, a free, full-featured, open source, cross-platform audio editor, is the perfect tool for producing podcast-like audio files, CDs, digital magazines, greeting cards, video podcasts, and any other kind of audio that needs converting into something more than static (and that's a lot of audio)," writes Kevin Egan, an audio and video programmer who works at AVID Technologies. "It has a simple and intuitive interface, a wide range of output options (including mastering CD burners), and it makes audio as easy to edit as sound files on a Windows machine. The program is simple to use, not intimidating, and powerful enough to do the job." Kevin Egan AVID Technologies www.avid.com 5. Adobe In

In the American Society for Testing and Materials standard for general aviation, "ASME A18.1-2001, 'Standard Practice for Lighting Systems for General Aviation Aircraft', and 'ASME A18.1-2006, 'Lighting of Small General Aviation Aircraft,'" current guidelines provide a minimum of five lights at the wing tip and two lights on either sides of the vertical stabilizer/aileron. However, the minimum lighting level at the wing tip is insufficient for following pilots to operate an aircraft using appropriate procedure. In addition, current minimal lighting regulations do not provide sufficient lighting in the cabin to permit others to navigate or land, or even determine the status of the pilot. Therefore, there is a need for an improved system and method of lighting aircraft. Why does menopause linger? The main problem with ageing is the marked decrease in reproductive capacity associated with aging (the average woman in menopausal years has a lower ovulation rate than that of a 20 year old). Loss of oestrogen increases cardiovascular risk. The risk of breast cancer increases with age and with the length of the menopause. Malignant conditions can also increase in number; there is an excess of small bowel cancers in menopause and a decrease in number of cases of large bowel cancers. The most common cause of death in women above the age of 40 is malignant disease. Menopause is associated with an increase in total mortality among those over 65 by about a factor of three. The risk of Alzheimer's disease and Parkinson's disease is increased by about a factor of four. Other age-related diseases may also increase in prevalence with age. Disorders of the central nervous system may increase in numbers; senile dementia of the Alzheimer type is the best known condition but the cholinergic hypothesis has stimulated exploration into other areas. There is no way of predicting who will develop Alzheimer's disease and few signs may be present in the early stages. In the most common form of Alzheimer's disease there is a pattern of cognitive decline which also fits the 'predominant insult' theory. There is evidence that there may be a window of vulnerability which may be penetrated by any insult. Nerve growth factor may increase the risk of Alzheimer's disease but its main role is in neural growth. Many nonneural illnesses are associated with menopause. The musculoskeletal system is affected by the decline of oestrogen and the balance of bone remodelling shifts towards bone resorption

A number of transplant procedures have been developed for the purpose of replacing diseased organs with allografts. Many of the operative techniques employed in these procedures employ living-donor transplants. With a living-donor transplant, the donor organ is not removed from the donor. In living-donor transplants, cells, tissues, or organs from a donor are transferred to and transplanted into the recipient without removing the donor organ. In some cases, the recipient organ, rather than the donor organ, may be removed from the donor for the purpose of the transplant procedure. In other words, with a living-donor transplant, the recipient organ is typically transplanted from a living donor. Because of the need for donor organs for such transplant procedures, live donor transplants have become a standard part of transplantation procedures. In many instances, the donor organ is incorporated into the recipient at the time of the transplant procedure. For example, the recipient may be placed on a ventilator for several hours so that the chest cavity of the recipient is opened up to allow access to the recipient's heart, lungs, and circulatory system. The donor heart is then removed from the donor and inserted into the recipient's circulatory system via a bypass procedure. Thus, with a standard heart transplant procedure, the recipient is on a ventilator while the transplant procedure is being performed. This procedure is known in the art as a "ventricular heart assist" because the donor heart is typically stored in a chest cavity, i.e., the donor heart is stored in the chest cavity of the recipient. In other procedures, known as whole organ transplants, the organ is removed from the donor and subsequently implanted into the recipient. For example, in a liver transplant, a liver is typically removed from a donor and surgically inserted into the recipient's abdomen. In some transplant procedures, the donor organ is blood-perfused prior to transplantation in the recipient. In such procedures, the donor organ is perfused with blood from a donor via a donor-recipient bypass to minimize ischemic damage to the organ prior to implantation into the recipient. In both ventricular heart assist and whole organ transplant procedures, there is the risk that the transplanted organ may be damaged or destroyed because the donor organ is not promptly transplanted into the recipient. For example, if the transplant procedure is a whole organ transplant procedure, the transplanted organ may be damaged by ischemic events in the donor organ due to lack of
