Working in Photoshop is as simple as dragging and dropping image parts, photos, or shapes to the canvas and then adjusting and moving them. Chapter 14 explores working with layers to put different parts of an image on top of one another. Even if you have little experience with image manipulation, Photoshop can be an incredibly useful tool. As an image editor, it excels at providing a more realistic representation of an object than, say, the basic imaging program included with your scanner. If you're digitally photographing a still life, a photo of your kids wearing old clothes, or even a fashion shoot, Photoshop can make it more interesting or convert an unappealing image into a more appealing one. Resizing images Although Photoshop is primarily a raster-based (pixelated) program, it is often used to resize an image. Resizing is changing an image's dimensions to make it larger or smaller on the screen. A portrait photo that was originally printed at a 4 × 6 inch is commonly reduced to a 3 × 5 inch document in order for it to fit on a standard 8.5 × 11 inch page, for instance. If you have an image that was saved in a JPEG format as a bitmap, that format is a non-lossy one. This means that when you open the file, it's the same image as it was when you saved it. However, when you resize an image, you lose some of the quality of the image, depending on the amount of reduction. So the more you reduce the image, the more it loses quality. Likewise, the more pixels you add to the original image, the higher the quality. You can resize an image in three ways: By resizing the canvas: To resize an image, you can use the Resize Canvas command in the Edit menu. Choose Image⇒Image Size. Then move the sliders in the dialog box, as shown in Figure 6-6. The up and down sliders allow you to control the size of the image. Click the center to lock in the size, and the dialog box closes. You can also resize the image in an image adjustment layer, as described in the next section, if you want to rescale an image without changing the size of the canvas. (Resizing the canvas may affect the size of the image in the layers if you use layers.) By making an adjustment layer: If you want to resize an image in a specific layer (

AdvertisementToday we continue our journey through Twitter API methods. We'll look at the one-way method polluting the datasets for all the time. The process is already long, and it will only continue. Go on, let's learn. But let's first go over some basic information. The Twitter API allows you to 1. Return all the text messages in a user's timeline 2. Return all the followers of a user 3. Retrieve the followers of a user and all their text messages 4. Query by keyword 5. Retrieve the 10 most recent messages from a user, with a maximum of up to 50 6. Retrieve the most recent 10 messages from a user and their followers 7. Retrieve messages from a user which have been mentioned by other users. This post will only be focusing on Twitter User. But feel free to join our Slack to discuss API design and architecture. We want to store all the tweets that a user has liked. We want to store all the tweets that a user has retweeted. We want to store all the tweets that a user has favorited. Let's begin with creating a schema to store a list of Twitter user ID's: user_id:string Note that these are the 1 and 2-character unique IDs of each user. Which means there are 27,177,312,582,656 unique IDs, and all of them will be added here. A User can have many followers, and a user can have many friends. Suppose for a user x, his followers are a, b, c and his friends are d, e, f. A User has many Tweets, and a user has many TweetsLike. So, we have the following database schema: Followers:user_id,count Friends:user_id,count Tweets:user_id,text,created_at TweetsLikes:user_id,user_id,item_id,like_status,created_at This will create a user table, and three additional tables. But before we continue, let's define a basic Twitter type. The four basic type of Tweets are: 1. Direct messages 2. Mentions 3. 05a79cecff

Delaware State Police say a dead teenager's body found in a creek is that of the 13-year-old girl who went missing more than two weeks ago. Police announced Thursday afternoon that the remains found in the Christina River in Wilmington on Tuesday were those of the missing Elizabeth Warren. Police announced the information during a news conference at city hall. "I have to tell you I can't tell you exactly how it happened, but we have good evidence to suggest that," Delaware State Police Sgt. Paul Mifsud said. Police had been calling Warren a runaway ever since she disappeared on Aug. 9. Her father also identified the remains as hers. Earlier this week, Mifsud said he had received substantial new evidence from the FBI. The FBI was assisting in the investigation. Delaware State Police said it believed that the body of the missing girl was found at the time the victim was reported missing. A sandal was found near the body. Forensic tests have indicated there were some "very, very close" similarities, Mifsud said. Warren's family said she had run away in the past, and had also gone back to live with her father in New Castle County. Her family released a statement Thursday saying they were "shocked and saddened" by the news of her death. "Our hearts are devastated with the tragic death of our beloved Elizabeth, and it is just unreal that this is the case we now have to deal with," the statement read. The statement said Warren went missing after she went with two friends to a neighborhood pool, and her friends were arrested on unrelated charges. Officers say Warren went to visit them on Tuesday and they were charged. According to investigators, the two teen girls who were arrested with Warren were trying to lure her to a home on that same day when she disappeared. Prosecutors said Warren's body was found in the Christina River on Aug. 16.This invention relates to a method of controlling the air/fuel ratio in an air-fuel mixture combusting system in an internal combustion engine, and more particularly to a method of controlling the air/fuel ratio in the mixture combusting system to achieve a desired flame length. A method of this type is disclosed, for example, in U.S. Pat. No. 4,274,991 (or published Japanese Patent Application No. 54-19,921 laid open to the

Q: iOS using a jQuery autocomplete to pass JSON data I am trying to work with the iOS HTML5 autocomplete control to take data from a remote database and insert into a form as a JSON object. Everything worked fine until I attempted to pass the retrieved JSON data to my controller method. I am using Xcode 4.2 and it only allows me to pass GET parameters. I've searched through numerous forums for a solution to this problem, but can't find anything. I've tried the following code: $("#inputTags").autocomplete({ source: "/Home/GetTags", minLength: 2, select: function (event, ui) { var data = { "tags": $("#inputTags").val(), "@tag": "", "@Value": "", "_id": "" }; $.ajax({ type: "GET", url: "/Home/InsertListItems", data: "data", dataType: "json", cache: false, contentType: "application/json; charset=utf-8", success: function (data) { //data = JSON.stringify(data)
