Q: A couple of questions regarding NSString and its strong and weak typing I'm trying to understand the relationship between both of these. I'm having a situation where I am having to fetch a large data from server and store it in an array for further processing. (Basically, I'm getting this through an API) I am storing the data in an NSMutableArray and as it is a large block of data, I've been forced to set the properties of NSMutableArray as instance variables. Now here's the questions: Is it okay to have the NSString properties of NSMutableArray as instance variables? (Will it affect the memory leak if yes?) What's the difference between strong and weak typing of NSString? (From my understanding, strong typing means it will retain any object while weak means it will loose it and will only copy the pointer) A: Is it okay to have the NSString properties of NSMutableArray as instance variables? (Will it affect the memory leak if yes?) No, that's fine. The array is allocated on the heap, so you don't care. The properties are strong, so once the array is deallocated, it will retain the string, but the string will never retain the array, so there will never be a retain cycle. If you did this: NSMutableArray *array = [[NSMutableArray alloc] init]; [array setObject:@"foo"]; [array setObject:@"bar"]; [array release]; The "foo" and "bar" strings would be freed. Note: you shouldn't release array if it has contents because the array has automatic ownership. You can release individual items by calling -setObject:. What's the difference between strong and weak typing of NSString? (From my understanding, strong typing means it will retain any object while weak means it will loose it and will only copy the pointer) It doesn't make any difference in this case (if you don't copy the string). NSString is a subclass of NSObject, and NSObject is a typedef to id. So the compiler does not actually check type, it just replaces id with NSString. However, the strong and weak typing can make a difference if you subclass NSObject yourself. NSString is a library subclass, and Apple's document class, but it is
