SOA Cleaner Express Crack

SOA Cleaner is a very intuitive front end for web services. The user has the opportunity to define the structure of the messages sent to a web service via a graphical user interface. For example a list of possible input parameters, or an XML schema that defines how the request is composed. Input and output parameters of all web service calls can be defined in a very intuitive way. SOA Cleaner will generate a graphical user interface that allows the user to define and compose messages that are compliant with the web service definition (WSDL) or similar standards as for example WSA. SOA Cleaner also provides the possibility to define assertions, and to test the data returned from the web service. For instance if a web service allows only positive numbers, the user can define the assertion that there should be at least one assertion in the results returned by the web service. The assertions are attached to the web service call, and the results of the web service call will not be allowed to pass the assertion test. SOA Cleaner generates the graphical user interface and supports all standards mentioned above. The following list of standards is supported by SOA Cleaner, version 1.4: Web service definition (WSDL). Web service description (WSDL). Invocation of web service descriptions (WSDL). Invocation of web services (WSDL). Web service security (WSS). Web service port description (WS-PORT-DESCRIPTION) Web service port type (WS-PORT-TYPE) Web service port binding description (WS-PORT-BINDING). Web service port binding type (WS-PORT-BINDING) Web service operation (WS-OP). Web service interface (WS-I). Web service contract (WS-C). Web service header (WS-H). Web service soap header (WS-SOAP-HEADER). Web service soap Fault (WS-SOAP-FAULT). Web service fault (WS-FAULT). Web service fault (WS-FAULT). Web service security header (WS-SECURITY-HEADER). Web service security fault (WS-SECURITY-FAULT). Web service fault (WS-FAULT). Web service fault (WS-FAULT). Web service simple header (WS-SIMPLE-HEADER). Web service simple fault (WS-SIMPLE-FAULT). Web service header (WS-HEADER). b7e8fdf5c8

First-pass checking: Identifies: URL (as local file path) Inbound port and inbound port parameters Inbound headers Inbound parameters Inbound fields Message contents Outbound port and outbound port parameters Outbound headers Outbound parameters Output content Even a 1/2-day test run of the OASIS Spring 0 release candidate shows that the message/document parser (taglib) can break a message into smaller pieces, and then link them into a message. It can also verify that message content is valid, and that the message has not been altered, although there are concerns about this. There is a problem with the metadata - the tags are: unrecommended. SOA Cleaner's preferred tools are: Taglib WSDL parser Message Formatter Synthetic message client Taglib: This is a very good tool. Initially I didn't use the developers' recommendations because I wanted to be able to generate code from a file directly. SOA Cleaner is able to do this with the taglib. Synthetic message client: This is a graphical representation of a client that allows you to build services that can be run by SOA Cleaner. SOA Cleaner's output can be validated by a client. It is very handy for creating and testing. Message Formatter: This is used to generate the output for the synthetic message client. It can generate all types of messages, including bad messages. It is easy to use. The developer advocates using SOA Cleaner's message formatters which are generated from the formatter. A commonly used formatter is SOA Cleaner's simple formatter that generates the skeleton of the entire document. While working with SOA Cleaner I have also experimented with: CXF - in some cases when writing your own code, you need to write your own wsdl-metadata-mapping file that you then import into CXF. There are better options. JAXB for Java/CXF for JAX-WS JAXB XMLbeans Pig Xalan Xerces That is my experience so far. I think we need to be cautious and go slow. If there is a problem with SOA Cleaner let us know. Thanks. "Stephen C. Smith" wrote in message news:

SOA Cleaner is a free tool developed to be an intuitive web service user interface. The set of features that the tool provides include: 1) Create SOAP requests using a graphical user interface 2) Assign variables to use as input for request or respond 3) De-serialize request as custom xml 4) Serialize and send request over http/tcp network 5) Assign meaningful names to variables so that you can save them in a custom format 6) Send a response or assert a result 7) Send an assertion/response 8) Send attachments as plain text to be sent in the response 9) Assign meaningful tags to variables for custom serialization The tool runs on a Windows platform.
