Photoshop Elements is a suite of programs intended to enable users to create, edit, and print images from digital photographs. It also includes tools for organizing and archiving images. Designed as an alternative to Photoshop, Photoshop Elements is very similar. Both programs contain overlapping selection tool, image-editing tools, and image-retouching tools. Elements also adds layers, palettes, and Photoshop-style effects. While Photoshop's interface and tools can be complicated for beginners, Elements' interface is generally more intuitive, and its tools are closely analogous to Photoshop's. Adobe claims Photoshop Elements has a "layer system that lets you effortlessly edit and enhance many types of digital photographs," and a focus on simplified tools that are "intuitive and easy to use." Elements can be used for simple image processing and editing as well as creating Web pages and interactive presentations.

Q: Finding H_2 for a system I'm currently working on a project about Riemannian geometry. In chapter 3 there's a question about the second kind of fundamental form. Let γ be a curve. Definition: Let $a, b \in \gamma$ and d be the Riemannian metric. The second kind of fundamental form is defined as $I = d\beta$ where β is the interior normal vector at a (i.e. the tangent vector of the curve in a point). By the fourth definition in the chapter we know that for $a, b \in \gamma$ $\beta(a) - \beta(b) = -\frac{\langle a-b, \dot{\gamma}(a) \rangle}{\|\dot{\gamma}(a)\|^2} \dot{\gamma}(a) - \frac{\langle a-b, \dot{\gamma}(b) \rangle}{\|\dot{\gamma}(b)\|^2} \dot{\gamma}(b)$ so the second definition says $I(a,b) = \frac{\langle a-b, \dot{\gamma}(a) \rangle}{\|\dot{\gamma}(a)\|^2} - \frac{\langle a-b, \dot{\gamma}(b) \rangle}{\|\dot{\gamma}(b)\|^2}$ It is given that $I(a,a) = 0$ for all $a \in \gamma$. I got the following solution set of $I(a,b)$ for this: $\begin{matrix} \hline a, b \\ & \& 1 & \& 0 & \& 1 & \& 2 & \& -1 & \& 0 & \& 4 & \& 0 & \& - \end{matrix}$

Q: python error No module named 'psycopg2._psycopg' I got this error when running python script. It only happens in virtual environment. error: No module named 'psycopg2._psycopg' Here is my python version Python 3.7.4 my python version in virtual environment 2.7.15 (default, Dec 11 2019, 23:24:42) [GCC 8.3.0] on linux Type "help", "copyright", "credits" or "license" for more information. `>>> print(sys.version)` 2.7.15 (default, Dec 11 2019, 23:24:42) [GCC 8.3.0] on linux `>>>` I know the general problem is right here: `import psycopg2` But I do not find my "psycopg2._psycopg" module is where I expect, not the directory package. I already installed it twice. I'm on ubuntu 18.04, python 3.7.4 A: The solution to this problem is probably the easiest one. Just go to the folder where pip3 is installed and check if the version of psycopg2 is really the same as you think: `ls /usr/local/lib/python3.7/dist-packages/psycopg2` If you get only the lib files there, try to update your pip3: `sudo apt install --reinstall python3-pip` Q: How to avoid creating unnecessary objects when using Java Generics? Why do the following code prints the elements as int in the expected output? `public class Generics { public static void main(String[] args) { List numList = new ArrayList(); for(int i = 0; i`
