We wanted to see how well Photoshop could simulate the analog process of photography by shooting a single image. In its Photoshop 13 update, we photographed a single living room wall in the company's headquarters, and used Photoshop to recreate the image with 1,000 layers. It turns out that even at its most layer-intensive level, the result is as close as Photoshop is ever going to come to the quality and feel of a professional, film-based photograph. Photoshop, the Living Room, and the Art of Tape When we first began researching for this article, we assumed we'd use Photoshop to add a fake texture to a photograph of a wall. But we weren't that ambitious—we wanted to see if we could use the program to make a single image—and decide what that one image would represent. The first idea that came to mind was history: We thought we would photograph a few living room and dining room walls in the company's Manhattan headquarters, then use Photoshop to capture their faux-historic, rustic, and dirty textures. But we quickly decided that wasn't an especially good idea. For one thing, we found that the reproductions of the textures in Photoshop weren't as accurate as we would have liked (at the very least, to find a reasonably close equivalent, we would've had to find a way to change all of the layers ourselves), and two, we were worried about the effect of tens of thousands of layers, which we weren't sure how to separate from one another. We considered other options, including archiving the images we had gathered of historical living room and dining room walls as a singular image. We also considered a more rudimentary approach, including taking a single portrait photograph of each wall. While we never did choose that route, we did think about what a single image might represent. When we began photographing the walls, we were intent on photographing one per room (i.e., one wall per room, with a one-to-one relationship between the walls, saving each photograph into a folder), because we were curious to see what, exactly, we could tell from just one photograph. And we were also curious to see what other images we could create from a single photograph using Photoshop's layers. This meant that we would have to photograph one wall per room. We considered a few options for capturing each of the walls, including using a Nikon DSLR camera

Q: Testing Azure Resource Manager Deployment with Xunit We have a set of Azure Resource Manager templates that define a bunch of logical resources, some of which are scoped under configurable environment variables. Template XML is very concise and terse; for example we have: `!(Test!(ArmResourceManagerTemplate)) $(ConnectionStringForTestResource)`
`!(Test!(ArmResourceManagerTemplate)) $(ConnectionStringForTestResource) !(TagResourceMessage)` If I deploy the template I expect to be able to get some sensible output for the relevant configuration settings (for example, the connection string should be displayed in the output). I have tried various combinations of `--verbosity` and `--output`; for example, the following outputs the environment variable value. This isn't what I'm after, it's only useful to check the template runs the expected operations. `$http --verbosity medium -f $TemplatePath -v $AzureFolder/arm-template.json --preview --outputxml "$ProjectFolder/Test.xml"` What is the correct output format for testing an ARM template? A: You can use the Azure CLI to view the properties of resource groups. The command line call for this is: `az group show` You can actually have your ARM files generate an xml output as well and use the xml output to verify your files are setting the correct values. This is what I do in my repo. With my test I verify that the resource group has the correct tags. `# app` will be the name of your resource group `az group show -n app --output tsv # vi app.xml`

Let us write $f(x) = \sum_{i=0}^d a_i x^i$. Suppose that $a_0 \neq 0$, and that $|f(x)| \geq \max(|a_{i-1}|, |a_{i-2}|)$ for all x . Is it possible to find an algebraic integer a such that $f(a) = 0$ and $|a| \leq \frac{1}{2} \max(|a_{i-1}|, |a_{i-2}|)$? A: Yes. Choose any nonzero $a \in \mathbb{Q}$, and let $L = \mathbb{Q}(a)$. Then L is a finite extension of \mathbb{Q} , and $f(a) \in L$, so $f(a)$ is a root of a polynomial over L of degree d . By the Prime Number Theorem, there exists a prime p such that $p \mid d$ and $|f(a)| \leq p^{-d/2}$. Thus, $|a| \leq p^{-d/2}$.
