Photoshop CS5 has another benefit for beginners. It provides features to help you create a project plan for your images and edit it. You will use the idea of layers to understand this important function. You will learn how to use the Release Lock feature in Action to help you get a cleaner preview before you hit the print key. You will see how to work in an unlimited number of monitors. You will learn how to adjust the size of your image as you make it larger. You will be introduced to a variety of actions that will save you time if you want to perform some of your own customization. You need to understand layers first before you can master your adjustment of an image and the use of Photoshop's many actions. Photoshop CS5 is a logical step for beginning photographers because it provides great tools to make your images look their best. Exploring Layers Layers work behind the scenes of images. Layers are a fancy way of saying that you create multiple images that allow you to modify or mix images, color, and shading layers for each image. By creating multiple images, you can manipulate one image to make a picture that looks like it has been created by a professional. Layers allow you to work in batches, so you can apply many adjustments to many images at once. You can combine them or separate them into different files. Then you can print or save them separately or use them together for print or web use. In Figure 4-1, you see images layered into the background, each with a different layer color. Because I have several images that need to be adjusted, I saved this as a multipage document. Photoshop CS5 provides many other options besides saving images in multipage documents. You can save an image to a file, and you can also make an adjustment to individual images. Note the two images that are partially cut off in the background. In this case, you see them better in the Windows Explorer or Finder window because they are listed on the right side. Although you can save layers, you don't have to. You can save, print, and manipulate images normally and then save the result as a flattened file. This saves a lot of memory on your computer. You can also save the flattened image as a PDF file, edit it, print it, and save it again as a flattened file. It's best to take this route if you want to do any of the following: Save and print your image

Q: OpenGL ES 2.0/2.1/3.0 background color doesn't change to color of current context. Setting background color fails What I want to do is set the OpenGL context's background color to the context's current color, so that every render would be on the same background color. I'm following a tutorial which shows how to set the background color to context's current color like this: gl.glClearColor(0.0f,0.0f,0.0f,1.0f); Setting up a new context and rendering with a background color of 0.0f,0.0f,0.0f,1.0f works fine. For the lines that follow gl.glClearColor(0.0f,0.0f,0.0f,0.5f); This will have the same background color, but the rendered lines are rendered as white. I have a question, what am I doing wrong? Why is this not working? A: The answer was found in the comments of the tutorial. It appears that this isn't currently possible in OpenGL ES 3.0.
