A word of caution: Even though Photoshop is a popular tool among photographers, design pros and students, it is best used by people who understand what it is and what it can do, what its limitations are and what it is best used for. ## Understanding Photoshop Layers When you work with Photoshop, you create a new layer at all times. The reason to make a new layer is that you may want to place more than one image or text layer on the same image. You can easily edit multiple layers without affecting the others, by altering each individual layer. Photoshop layers are like sheets of paper or sheets of fabric. When you place a new layer, you turn the white of the paper over to the back of the sheet. Then you place your images or text on top of the previous layer, and you move the topmost layer down to the back of the sheet. On the back of the sheet, you add another layer and repeat the process. You continue until you no longer need to make additional layers, and then you remove them all. In the process, you've turned back the white of the paper over to reveal the opposite side. For example, imagine a photo that you want to share on your website. You make a new layer on the back and add your image to the new layer. You then make an additional layer on the back of the same sheet of paper and add more content to that layer. Repeat until you no longer need to make additional layers. When you finish, the white of the paper is on the back of the sheet and the original photo is visible. By adding and removing layers, you can reuse the same elements several times in different ways. For example, you can add a layer that contains all of the images you want to keep from a family portrait that needs to be edited. Then you remove that layer and save the original image. Note that a Photoshop layer is essentially a digital stamp. You place images or text on a layer, and when you save or print the file, the new layer replaces what you just added. A Photoshop document is simply a container in which multiple layers reside. After you make a layer, you save it as a file. You can create, move, and resize a layer as well as merge it with other layers or duplicate it. You can add text to a layer by typing on the layer or into a placeholder field. You can apply filters to the text, such as the ones you read

Q: Apache/Jetty - sending request and receiving response with http basic authentication I have to work with a web site that has basic http authentication. We have a java program that is sending requests to this site via http. However, we need to be able to send the requests and receive responses to/from the site directly without going through the user's browser. I have the basic http stuff working, but am having trouble taking the returned response and then sending it to the user using the java program. The example code is: /* * This example demonstrates how to send a POST request and obtain the response * in native Java. */ import java.io.ByteArrayInputStream; import java.io.InputStream; import java.io.OutputStream; import javax.servlet.ServletException; import javax.servlet.http.HttpServlet; import javax.servlet.http.HttpServletRequest; import javax.servlet.http.HttpServletResponse; import javax.servlet.http.HttpServletResponseWrapper; public class HttpClientDemo { public static void main(String args[]) throws Exception { // Authenticate as user "user" String username = "user"; String password = "password"; String basicAuth = "Basic " + org.apache.commons.codec.binary.Base64.encodeBase64String(username.getBytes() + ":" + password.getBytes()); // Create web connection org.mortbay.jetty.HttpConfiguration config = new org.mortbay.jetty.HttpConfiguration(); org.mortbay.jetty.Server server = new org.mortbay.jetty.Server(8000); // // Configure proxy // org.mortbay.jetty.http.HttpConfiguration.ProxyServer myProxy = new org.mortbay.jetty.http.HttpConfiguration

Q: Why can't I use auto in this case? I don't understand why I can't use auto in this situation? I think, it is possible. template typename std::enable_if::type foo(int type) { } A: You cannot place an int at the place of T. The conditional statement implies that T has to be a class type or a struct type. The standard also requires that, if T is not a class type, then the conditional evaluates to an integral constant expression of a type with a public non-virtual non-explicit const conversion function to int. And your return type is void. This means, your return type is fine. But, there is no valid condition which indicates that T is a class or struct. You get that error. Q: Can the frame pointer (RSP) be used for loop variable? I am reading the book Agile Software Development by Uncle Bob. On one of the examples he wrote: In a dynamic array or any assignment, the frame pointer can be used to store the first field of each element. Is this a valid way to save a variable at the beginning of a loop body, if instead of an array one has a bunch of variables? If so, why is that? Is that a good practice? Is it general? Can you give me a link to a reference or something? A: Technically if you want to save values of local variables in the frame pointer, you need to save 8 bytes. For example, given this loop1: int a; int b; int c; if (something) goto loop1; It's easy to see that we can save a, b, and c in the frame pointer, to save 8 bytes. So, unless frame-pointer based variables were introduced in an early version of C (C89), that doesn't sound like a good idea. One exception (in which I used to program) is __attribute__((used)), in which you can declare a local variable in a function using a register. So you might be able to declare your local variable with __attribute__((register(fp))) int a; but the exact details
