History: Photoshop stores all actions that you take in the History panel. Click the History button in the upperleft corner of the program window to access this panel. Layer Styles: This panel provides access to the many layer styles that you can apply to create different effects. I explain how to apply layer styles throughout this chapter. Paths: Click the Paths button to open this panel, which enables you to create, edit, and work with paths. I explain more about paths later in this chapter. Brushes: These brushes enable you to apply canvas textures to your images. I explain how to create and apply textures to images in Chapter 20. Gradient Maps: The Gradient Maps panel enables you to create and edit gradient maps. I explain how to use gradients in Chapter 21. Gradient Swatches: This panel enables you to apply pattern and textured gradients to layers. You can apply different pattern styles in Chapter 21. Adjustment Layers: This is the panel in which you can change the appearance of the image by setting different contrast, brightness, and color corrections. I show you how to use Adjustment Layers throughout this chapter. You can access any of these tools by clicking the Toolbox button and selecting a tool. A layer is the building block of any Photoshop image. Although it's not necessary to understand layers for making an image, you do need to know how to create and add layers to your images because they're the foundation of virtually any Photoshop image you create. A layer is a powerful concept in Photoshop. It provides an overlay for the pixels of the image, making it easy for you to add text and other elements. For example, to add a new layer, choose Layer⇒New (in Windows) or Layer→New (Mac) in the Tools panel. Your next move is to name the layer, which enables you to give it a name so that you can easily identify it later, as shown in Figure 14

The Spinal Cord Injury and Disability Index (SCI-DIS) is a self-report questionnaire originally developed in English for the purpose of monitoring the quality of life (QOL) of individuals with spinal cord injury (SCI). The goal of this study was to evaluate the reliability and validity of the Italian version of the SCI-DIS in measuring SCI-QOL. The sample consisted of 108 individuals with SCI (mean age, 38.9 +/- 11.8 years) who were recruited from persons attending the SCI unit of the Rehabilitation Department of the University of Milano-Bicocca, Milano. Psychometric properties of the Italian version of the SCI-DIS were assessed using both classical test theory and Rasch analysis. The SCI-DIS has an unidimensional structure with a high internal consistency of the 16-item scale (Cronbach's alpha =.95). The domain scores of the SCI-DIS were highly correlated with each other and with the total SCI-DIS score. No evidence of differential item functioning
