November 25, 2012. Bump version to 1.0.0 to fix binary incompatibility with 1.5. [closed] Â . However, I think the above is a little off topic.

Therefore, I will ask about stable UDF (User Defined Function). In VML, I use it to create four kinds of macros, and I also want to use this method in OCaml. You can use ffi for this task, but are you please to set up the environment? Now, I am developing a program in C++, and I want to write a function that exports this function to pascal. The program is a image filer with multi-layer selection (any position of image, and any coordinate of image can be selected, but only rectangular can be selected). I have been searching the internet, and I can't

---

find a good solution. The program is written in C++, and I want to export this function to pascal. I have been searching the internet, and I can't find a good solution. Simply put, my file operation program works like this: Select one or more images by position and filename. Save in vector format or bitmap format. I found some old program, which I think is a Java program, but I can not understand it. My question is: Is there a good solution for me? (I want to create a function that export a "my function"(or its processing function) of C++ to Pascal). A: You may be able to use ffi and OCaml to create a library from your C++ code, then use this library from Pascal. Ocaml has a really good description of the functionalities of ffi here. Also, if your library is a set of functions that export at most five functions to the FFI, I don't believe you need to worry about the number of arguments in the exported functions: if they have five arguments, the number of arguments of the OCaml function will automatically be five. Nevertheless, it seems that you want some C++ code that takes one argument and returns a tuple, with the tuple consisting of the results of processing that one argument. This is a pretty

---

reasonable thing to want to do, and ffi will allow it. However, you'll have to write a type that represents the return value of your C++ function, and a signature that corresponds to the type and the
