A computer with a slow working hard drive will not boot if not configured in a correct way. Check if there is no hidden or corrupt partition. A "boot" operation is a series of instructions that is executed by a computer when it starts up, and is responsible for booting the computer into its default operating mode. The boot process is divided into several phases. Some of these phases are part of a boot process, while others are performed during a Windows session or application installation. Boot Configuration Data (BCD) is a location on the Windows-based operating system that stores all system information. This information includes boot information about the current partition, the Windows boot manager, the local machine, and personal user information. The BCD file is located on the master boot record (MBR) and it is also present on the Windows Setup partition. In case you have a slow or corrupted boot record (based on general information), there is little you can do to fix it on your own. Just visit a Windows 8, 7, XP, Windows Vista, Windows 7, Windows 2000, Windows Server 2008, Windows Server 2003, Windows Vista, or Windows 2000 Repair Disk page. There, you will find an easy-to-follow guide that will help you fix the boot record. In order for Windows to be able to boot properly, it is required to have at least one boot sector. A boot sector is a small file located in the first sector of a drive, and it contains the boot program that has to be executed. You can boot a system without the presence of a boot sector if you use one of the following Windows tools, but this does not mean that your system will be able to boot: - diskpart (if you have the setup tools installed) - bcdboot (if you have the setup tools installed) If the boot sector is damaged, you will not be able to boot your system. A quick way to check whether the system supports booting is to go to Command Prompt (cmd), type the following commands, and then press Enter: bootrec /fixmbr bootrec /fixboot If the system still cannot start, it will likely be due to a hardware issue. A hardware failure usually leads to the system not loading at all, and you will not be able to boot if it is the case. Although you can fix the problems on your own, this will not help if the problems are solved on the motherboard
