It supports RAW images from many cameras. A Photoshop plugin also enables it to open and process images from Adobe Lightroom. You will learn how to edit images with Photoshop Elements in this Photoshop Elements 10 tutorial series. Some of the tools you will learn to use include: Structure Adjust, Black & White, Color Correction, Curves, and more. You will also learn how to use the smart objects that are available for editing such as text layers and selections. With the help of this tutorial series, you will learn how to remove unwanted backgrounds from a photo, resize pictures and edit photographs. Step 1: Opening an Unsaved Image You will need the following image that is saved to your computer: Open the image from your computer and make it the active document by clicking on the Open Menu (File) in Photoshop Elements. Or you can just select the image in the tool bar as well. Now to launch the image into a grayscale view, click on the Grayscale Icon (View) in the Edit Menu (Photoshop Elements > Edit). In this tutorial, you will use the Grayscale View to create a new document using an image that is already opened. Step 2: Create a New Document Using an Open Image Now that the image is opened in a grayscale view and you are ready to create a new document, you will click on the New Document Icon (A) from the File Menu. In the New Document dialog box, fill the File Name and Location fields with appropriate values. Now click on the OK button to create the new document. You can check the name of the new document by clicking on the View Tab and looking at the name of the document in the upper left corner. Step 3: Renaming an Image You can rename the image at any time by clicking on the Rename Icon (R) in the toolbar. You can type a new name for the image and then press the Enter Key. This will open the Renaming dialog box. Now you can type in a new name for the image. Step 4: Duplicating a Layer If you want to cut out unwanted parts of an image without destroying any of the original image, you can use a duplicate layer. To make a new layer, you will press Ctrl a681f4349e

On this episode of History of Battlefield, we're looking at High Command and what else it will be hosting. Currently listed on the Steam database as a Front or Operation game, of course we could be wrong on this. Not a huge deal, but I really want to find out more about it. As always, we start with the piece of the puzzle; the new "Long War" update to Battlefield 1. We recap on the changes made to Hardline and what we want to see in the future. The content of the show is collected from a variety of forums and other places, but is not meant to be cited or used to identify who was the source. We also discuss some of the new maps that have been released and we take a quick look at the replay mode to see how to access and record your games. Thanks so much for listening to our show and hope you enjoy it. Enjoy our new playlist and feel free to leave us a rating on iTunes if you like it. I have a simple mysql table with only a few rows. I want to add a new row to this table. How can I do this without losing any of the old data? A: First, make sure your table in mongodb is named same as you were using in mysql check how it's "INSERT" in mongo shell "INSERT IGNORE" in php Second, make sure you have a unique index on your field, since it's not mysql, you probably have to use it in mongodb. The present invention relates generally to the field of electrical transmission line communication systems, and more particularly to an electrical, or electromagnetic, repeater antenna system with an adjustable electronic interface circuit. Communication systems are well known in the art for transferring data between two locations. One known system, for example, uses a copper pair communication line installed in a conduit, or buried in the ground. This communication line may be used, for example, to transmit and receive data, voice and video signals, etc. In one such system a local communication unit is mounted to a house or an office for transmitting and

Q: How is mount point determined for a mount point? I have accidentally created a mount point but I have not created an entry in fstab. Now I see there are entries that look identical to mine. How is the mount point determined? The fstab of the mount point matches mine as well. A: This article may be helpful to you. Basically they use the /etc/mtab file. A: The link in the answer posted by anthony is a good and quick resource to read when you have a simple understanding of the 'magic' behind the mounting. Particularly: The mount table (mount.table in some older systems) is consulted whenever an unmounted file system needs to be mounted at the time it is being accessed. If the file system was mounted in the current run, then it is already in the mount table, and the access is fulfilled by simply mounting it again. If the file system was mounted in the previous run, then it is not in the mount table, and the access is fulfilled by mounting it again. If the file system was never mounted, then it is not in the mount table, and the access is fulfilled by mounting it again. If there's a need for consistency (you have a mount point), it's because the mount table was updated before mounting was completed. Links to the mount table manipulation: Update-system-mounttable(8) : Manipulates the contents of the mount table used to obtain the list of mounted file systems. Mount-ed or Remount-ed or Unmount-ed or Unmount-all(8) : Remount all mounted file systems. Check-mounttable(8) : Retrieve the list of mounted file systems, for example, into a suitable list format. Gedcom (8) : a groff(1) fragment for the GNU groff 1.18 A: There is no sure-fire rule for this: see e.g. how ext3 chooses a mount point. You'll need to check fstab on your own system. Q: finding error message is not showing in mvc.net webconfig file
