Q: FileOutputStream with return after writing I want to write binary to the disk. The object is: FileOutputStream fileOut = openFileOutput(file, MODE_PRIVATE); fileOut.write(((Bitmap) bm.copy()).getPixels(0, 0, width, height)); fileOut.close(); return bm; However, there seems to be some problem reading the result since I get 0xaaaaaaaaaaaaaa. If I omit the return line I get correct image. How to write to the disk and read it back properly? A: Since you've already written the file, you probably get back 0xaaaaaaaaaaaaaa because it was overwritten. That 0xaaaaaaaaaaaaaa is the binary representation of that file - it's not a valid file. If you wanted to do any file I/O, you should use OutputStreamWriter with the write(byte[] b, int off, int len). Since you have an already written file, you should use OutputStreamWriter.write(byte[] b) instead. EDIT: (copied from comment) The android framework inserts newlines after writes, so this results in random data. 1. Technical Field The present invention generally relates to an electrical connector assembly and in particular, to an electrical connector assembly for joining two mating electrical connectors. 2. Description of Related Art Two mating electrical connectors are engaged with each other for electrically connecting electronic components to a printed circuit board. An electrical connector assembly including a first electrical connector and a second electrical connector is used for attaching electronic components to a printed circuit board. The second electrical connector is received in a housing of the first electrical connector. The housing provides at least two passageways and a latch unit extending from each passageway to engage with corresponding pins of the second electrical connector to retain the second electrical connector in the first electrical connector. However, when the second electrical connector is inserted into the first electrical connector, the latch units of the second electrical connector only extend into the passageway of the housing, and the latch units are not engaged with the pins of the second electrical connector to prevent the second electrical connector from being detached from the first electrical connector unintentionally. In addition, because of the increase of number of

[Sparse pattern analysis of the color Doppler waveform]. Recent researches and reports on color Doppler ultrasound have clarified the definite characteristics of the blood flow such as pulsation and continuity. These phenomena are analyzed mainly by means of the nonstationary time-series analysis. The object of this study is to present the use of the sparse time-series analysis for the analysis of the color Doppler ultrasound, especially the waveform. We applied the algorithm of the sparse time-series analysis to the color Doppler ultrasound waveform obtained from 27 normal volunteers and the ones from 20 patients with tumors of various sites. Based on the nonstationary time-series analysis, we analyzed the characteristic of the sparse pattern in the waveform of color Doppler ultrasound. For the analysis of the characteristic of the sparse pattern, we proposed a novel feature named sparse-pattern-amplitude (SPA). By the SPA, we extracted the frequency-dependent variation of the amplitude of the sparse waveform. In this study, we demonstrated that the SPA represents the local features of the waveform, and that the SPA is useful for the detection of the features of blood flow in the tissue. The SPA is a new tool in the analysis of the color Doppler waveform of ultrasound. Resistive random access memory (RRAM) can be used as an electric non-volatile memory. Resistive non-volatile memories of resistive random access memories have resistive elements with programmable resistive values, for example "on" state or "off" state of the memory cells. Some resistive non-volatile memory elements have a resistive cell structure with a top electrode, a bottom electrode, and a resistive layer between the top electrode and the bottom electrode. The resistive value of a resistive cell may be programmed by applying a voltage difference between the top electrode and the bottom electrode and applying a program current through the resistive cell. The resistive value can be detected by applying a read voltage to the top electrode and the bottom electrode. The present invention relates to a hinging appliance, such as for example, a patio door, of the type comprising a base frame provided with a horizontal axis and a vertical axis, and two vertical hinged panels that are hinged at the ends thereof to the base frame and the panel is hinged at the middle of a longitudinal edge thereof to the base frame. For the closure of the hinged
