Field of the Invention This invention relates to a bistable hydrogen sensor. 2. Description of the Prior Art In the process of the invention, a bistable hydrogen sensor has the structure comprising a light transmitting glass or plastic base onto which is formed a sensor head section or "cage" made of an opaque material which is transparent in the desired detection wavelength. This section has a polished spindled cylindrical configuration. The cylindrical walls, which are also transparent in the desired detection wavelength. A platinum electrode (i.e. a working electrode) and a platinum lead wire extend through the space between the inner and outer walls. The upper end of the working electrode is covered with platinum so that it is flush with the upper end of the inner wall and the lower end of the inner wall has a hydrophilic coating on its lower surface, so that a gas diffusion membrane, made of a polymer, is positioned thereon so as to contact the liquid above which is an aqueous solution of sodium chloride. A platinum reference electrode is immersed in the sodium chloride solution and a reference platinum wire is connected to it to form the working electrode, causing illumination. An optical fiber having the same wavelength of light as the mercury lamp light is inserted in the sensor head section to transport the light to an optical detector. When the sensor head section is exposed to hydrogen, the hydrogen diffuses into the salt solution via the gas diffusion membrane and the diffusion the salt solution via the gas diffusion membrane and the diffusion is on exceed to hydrogen, the hydrogen diffuses into the salt solution via the gas diffusion memb
