# \*\*Illustrator\*\* Illustrator is a raster-based vector graphic editor that produces vector and raster images as well as layers of an image. It can create shapes, paths, and text, and can be used for simple image editing and illustration. Used more for design and layout than photo image manipulation, Illustrator can save a large quantity of raster images, especially when adjusted to save "painterly" effects in the default appearance. The program doesn't have pixel-based layout tools such as those found in the other Adobe programs. Instead, it uses Photoshop-like paths for moving, shaping, and styling. Illustrator also offers access to a database of drawing tools, as well as access to Adobe-specific fonts and letters. To be an illustrator, you must be able to design and create rather than just edit and re-edit, and Illustrator lends itself to this task. It is common to use Photoshop to make a mockup in Illustrator, and then go back and do the finishing touches in Photoshop. The reverse is equally common. Illustrator is much easier to use than Photoshop, especially if you are working on a tight budget. However, like Photoshop, Illustrator does not have a suitable zoom tool and has a limited selection tool that isn't as useful as Photoshop's.

The successful operation of a computer includes many steps in the execution of an operating system, application software, or other types of software. Some of these steps, such as the power-on self test (POST) or boot up sequence of the operating system, are written into the executable code such that these steps are always performed by the computer. One reason for writing these steps into the executable code is that the computer has a finite amount of resources (e.g., memory, flash memory, BIOS ROM, etc.) that can be allocated to these steps. If the operating system or other software is removed from the computer, these steps are lost. As an example, a RAID (Redundant Array of Independent Disks) system can include a number of hard disk drives (HDDs). Because of their importance in computer systems, hard disk drives (HDDs) will be used as an example throughout this document. One reason for using a RAID system is to provide reliability and fault tolerance against, for example, a failure of one of the HDDs. To accomplish this, the RAID system may backup data that is stored on the HDDs to another HDD and/or another computer. For example, if a failure occurs in one HDD during the data backup process, that HDD's data may be recovered from the other HDD and/or another computer. Q: Laravel Dynamically define message for not-found routes I have created a route for my employee-controller, and I want to define dynamic route that goes to /employee/id/not-exist with a 404-error. I am stuck with the right syntax. Route: Route::get('/employee/{id}/not-exist', array('as' => 'employee.not-exist', function(\$id){ return Employee::find(\$id); })); I want to catch the 'not-exist' from the variable '\$id', and send a 404 with the view. I am expecting a "not-found route but the value is not in the URL" answer... A: If you are returning the 404 from the not found route, you need to add this to your \$app->force() function: if (strpos(\$url, 'employee') === 0) { \$allowed = 'employees'; } else { \$allowed = 'records'; }

CDR3 domain selection by the mouse B cell antigen receptor is independent of motif sequence. The specific B cell antigen receptor (BCR) repertoire is shaped by somatic recombination of germline gene segments to form the variable (V), diversity (D), and joining (J) gene segments. This site-specific rearrangement of V(D)J genes results in the creation of the CDR3 regions, which are the domains used by the BCR to interact with antigen. Here we address the possibility that sequence encoding the CDR3 regions in the mouse BCR mu chain contributes to a restriction of the repertoire. We have generated mouse transgenic (Tg) B cell lines expressing a chimeric mu chain with a murine-rat light chain (MRmu) that contains the murine VH and JH gene segments and a human VL region. The V, D, and J genes in MRmu are of murine origin and the VDJ region is in-frame. The transgenic mu chain was expressed at relatively high levels and is capable of mediating antigen-specific signaling. The MRmu(+) B cells from the transgenic animals display a restricted VDJ gene segment usage pattern similar to that seen for B cells derived from the same mice in which the endogenous mu chain was targeted with a human-mouse chimeric transgene. Analyses of the CDR3 regions showed that the B cells and T cells from transgenic animals express the same array of CDR3 amino acids as is seen in cells from nontransgenic animals, suggesting that the sequences encoding CDR3 regions do not contribute to B cell repertoire selection. This study is the first to show that the CDR3 regions are selected independently of the sequence encoding the region and that only limited sequence variability is tolerated. THE BEST COLORED EGGS FOR A FEW FUN PAINTINGS Fantastic hatching conditions and a neat recipe is all it takes for a splendid egg painting. A few brush strokes and great colors, and you have an original artwork for your collections. Catching the right colored eggs in your eggs sack is not that difficult - and it's just as easy to color them by hand. But it can be a bit challenging to catch the eggs in a homesteading or farming euation, as they need a few preparing steps. But let's be clear - there's always an easy option. I tried the homeschooling way and I am in love
