Wordpress.com For Desktop Activator [Mac/Win]

This web-based application has been extremely helpful to a business that primarily sells custom-built PCs. A Wordpress CMS is used to create a variety of web sites that are designed by the customer. The sites are custom built using Wordpress templates and custom themes. The website runs off a captive server where a variety of services can be added to the website for the customer's benefit such as a ticketing system, etc. After each site is built, it is often important to test it before it goes live. At a later date, it may be necessary to launch a website on a business' web hosting account with a web hosting company such as Host Gator. This means that the company would need to purchase a new domain name and a new web hosting account to avoid conflict with the earlier or future sites built using the Wordpress CMS. Rather than the customer having to contact the web hosting company to update the web hosting account with a new web address, a web-based application can be created to host the website from the web hosting company's web server. In this situation, the web-based application becomes the online equivalent of a browser-based application that can be hosted on a web hosting company's web server. At a later date, the website being hosted by the web-based application could be upgraded using the same process that is used by the customer to build the sites, and another site can be built using the Wordpress CMS. Or, the web application can be used to host a number of different customer sites on a single domain name. In this instance, the web application becomes the online equivalent of a browser-based application that can be hosted on a web hosting company's web server. In this capacity, the web-based application functions as a client-based application, and can be accessed using a web browser on a personal computer or laptop computer. The web-based application is designed to allow the customer to manage the site by hosting a Wordpress web site. However, as a standalone application, it is separate from the web hosting company's web server. The web application is installed on the web hosting company's web server and it is hosted from that server. The web application's files and database are stored on the web hosting company's web server. The web application is also connected to the web hosting company's database, allowing the web hosting company to update the database using the web application. This allows the customers to access the Wordpress web sites hosted by the web application from any location.
